We are also heartily in symps posal of the Secretary to dispose by sale of those of our older vessels, which are so deficient in certain necessary qualifications of a modern warship as to render the expenditure of a heavy sum of money upon them for repairs and reconstruction a very upon them for repairs and reconstruction a very doubtful policy. A few years ago England struck off the list and put up at auction over one hundred of her waiships, and there is no question that her uavy was the better for this very drastic pruning out of and decayed material

Although the proposal to squarate the work of the navy yard under the bread division of hall and terial is bused upon logical grounds, and would ulti terms is based upon logical groupus, and would immetely prove to have working advantages of a practical character, we think that the proposal to separate the work is somewhat premature and this for the reason that we have not ro-day among the negineering corps, a body of men of sufficient shop experience to qualify them for that oversight of the shops which is contemplated in Secretary Meyers shops which is contemputed in Secretary aspers a plan If the institution of a separate department of machinery includes as an indispensable corollary the training of a certain number of the naval engi-neers for primarint short daily as managers of the norts for prinarins more using an insumers of sitems engineering shops of the navy said the success of the plan would seem more certain. In any case, we believe that until such a trained body is available it would be advisable to continue both the steam engineering and construction shops under the management of the naval constructors

Now that the Meyer plan is assured of a lengthy period of trial the country may rest assured that the whole of the naval service affected by the changes will co-operate in a loyal endeavor to give the new plan such a perfectly fair trial as will serve to deter thal utility Therefo re we greatly regr to see that a prominent New York daily paper has so to see that a prominent New York daily paper has so far forgotten the dignity which attaches to its well deserved reputation, as to indulge in a bitter per-sonal attack on certain naval officers who have re-cently testified before the House Naval Committee, and that our contemporary has gone so far as to in-sinuate that because some of these officers were not in sympathy with certain features of Mr Meyers plan aly proper course left for them to p tender their resignations

It is unjust and misleading for that journal to omit to state that these officers had no choice in the matter of giving testimony before the House Naval Committee, when once they had been summ fore that body, and that it was the wish of the Secretary that they should reply to the questions of the committee unhampered by any consideration of whether their views were or were not in harmony with his own

So far from their frank express ment with certain phases of the Secretary's plan showing in any sense a spirit of insubordination, we rather take it to be evidence of a true moral cour-age which places the highest interests of the navy above any consideration of a purely personal char

Therefore to insinuate as does the New York Sun Therefore to linature as done to never tore until the navy that from these and other gentlemen in the navy who may happen to disagree with certain parts of the Secretary's plan, it would be impossible to secure proper co-operation during the coming months of trial, is to bettuy a complete ignorance of that high professional spirit which pervades the United States Naval Service, and is nowhere more conspicuous than in that hard working and little appreciated body of officers, the Naval Constructors.

### THE SCOTTISH SHIP CANAL.

HE British government having reviewed the various projects for a ship canal through Scotland, whereby the Forth and the Clyde can be connected, have decided that so far as naval requirements are concerned, the most favor-able route is that through Lochs Lomond and Long, or as it is generally called, the "Low Level Route Such a canal the government states would unque size a canal the government states would unques-tionably possess some strategical value, and as they would financially assist such a scheme, the promot-ers of the enterprise are urged to push the matter forward in commercial interests. The government, however, stipulates that the canal shall have a floor width of 148 feet, a depth of water of 35 feet, and locks 350 feet by 131 depth of water of 35 feet, and locks 860 feet long by 110 feet wide at the entrance, with a depth on the sill of 36 feet.

A see level canal was found to be impossible, for although the mean level of the sea is practically the same on the Clyde and the Forth, the level at high water is not, so that a sea level canal would postarp tidal currents which would involve serious in navigation

According to the designs which have already been prepared, the entrance to the canal from the North Sea would be a little distance north of Grangemouth. striking inland in a northwesterly direction, akirt-ing Stirling on the south and running into the Forth valley which does not attain a higher elevation than 30 to 50 feet above sea level, then passing through the haunch of Ben Lomond into the valley of En-This cut would be the heaviest on the whole route, the ridge attaining a maximum helpid of 260 feet above sea level But it is short Entering Loch Lomond, the waters of which are deep enough for the largest vessels asions, the loch is followed for 13 miles to Tarbet where mother cut is made through the neck of land, 1% miles wide separating Loch the neck of land, 1% miles wide separating Loch Lounoud from Loch Long The latter would be en-tered at Arrochar and this loch, which has a very great depth of water, is followed until the Firth of Clyde is reached opposite the Cloch Lighthouse The locks would be placed at either and of the canal that on the Clyde to lift the vessel to the level of the water in Loch Londond which is 22 feet above the mean level of the sea and the other at Arrochar to regain the sea level in Loch Long

The total length of such a canal would be 61 nautical miles of which 30 miles would be in canal and the other 21 miles in the open waters of Loch Lomond and Lock Long The deepest cuts would one of 191 feet near Stirling another of 285 feet the head of the Foth valley, and one of 142 test tetween Tarbet and Arrochar These cuts though The vessels will have to be deep are very short d at the F Forth end of the caust 13 feet at high water and 31 feet at low water, at Arrochar the lift would be 17 and 27 feet respectively in addition a regulating lock would be formed at the head of the Endrick valley to be used when Loch Lomond is in high flood.

high flood. Further advantages of this route are the avoid-ance of river deviations only comparatively small brooks being encountered, which could be easily syphoned across the canal Only one deviation would be necessary that of the Endrick which after all is only a stream. Again, the minimum of interference with the railroads will be offered. No swing bridges will be necessary and it will be possible for ves-to proceed without shortening their masts sharpest curve will have a radius of two miles. The construction of the canal will entail the excavation of 170 000,000 cubic yards of material, and its cost, ot the Admiralty requirements, would approxi

mate \$120,000,000 Work would occupy seven years Apart from its strategical value, the canal would have distinct attractions for commercial traffic. It will offer a shorter route between America and Europe, and will avoid the dangerous passage viz Europe, and will avoid the dangerous passage view the Peniland Prich The sextent of this "North About" traffic as it is called, including the coastal famile, is considerable, and the saving of from 150 to 500 miles in the sex journey of the transattantic research, according to the situation of the Bruropean port would be an important consideration. The sergets of this traffic which would use the causal is expected the sextent of the property of the sextent of the property o 10,724 805 tons per annum, and at an average rate of 77% conts per ton this would yield an annual reveaue of about 34,031,500, which after deducting 3300,000 as the annual cost of maintenance, etc would yield about 3 per cent on the capital for an Admiratiry cental. The achieves is being actively pushed forward, and so soon as some idea of what the government would be prepared to do financially is obtained, no difficulty will be experienced in securing the se mary financial support to construct the

### AERONAUTICS.

BE. Ader, the Franchman said to have flown about 1,000 feet in 1897 with his steam-propalled monopiane, the "Avion," has recently been decorated with the red ribbon of the Legion of Honor His machine is said to have embodied the wing-warping principle since patented by the Wrights.

Proceedings have seen begun in France to invalidate the Wright point No. 454,186, of March 24, 1944, and the Wright point No. 454,186, of March 24, 1944, and the patent was not worked in France within there years, as must be done according to the statute. In searching for anticipations the France inverse have seen of the statute. In searching for anticipation point No. 828 of Mathew Wett Boulten, granted in 1858, which provides movable wing tipe or "allerous" for the puryose of transverse stability in 1876 Rth off Harte, another Englishman, took out a patent (No. 1469) for maintaining transverse stability by means of revolving wing tipe operated by a weight

The second annual combined aeronastic and motor boat abov opened in Olympia, Indone (England) on March 11th Besides numerous small models, forty of fifty seroplanes and halloons were shown In addition to the regular French models of Wright, Bliefrid, Farnan and Santos Dumont, a number of British built deplicates were shown by well-known firms. as the Humber Company, for example In addition to these there were a number of new acropiance built by English inventors Interest in avia tion is very strong in England at present, and several tion is very strong in England of the coming sum

In preparing for a re-hearing of his case on the 19th inst, Glenn Curtiss has experimented to see how much resistance can be interposed at the ends of the planes of his biniane without causing it to sworve d small vertical fins 1x2 feet in size, and for that these could be set at right angles to the line of flight for a few seconds without causing the aero plane to swerve from a straight path and without moving the vertical rudder. As the resistance of the balancing planes which Curties uses is far less than obtained in the manner just des be no turning tendency produced by them, and hence no use of the vertical rudder in conjunction with them Mr Curiles has also flown with the vertical rudder tied and with it loose, showing that a movement of this rudder is not required. We also learn that the Autoinette monoplane has been flown with the vertical rudder left off With these practical nstrations of flight without the use of Wrights' natented combination, there seems to be ittle doubt that any infringement suits they may institute will be successfully defended

On Saturday March 12th, Aviator Louis Paulban ort straight line flight of 500 to 600 t at the Jamsica race track. The strong wind of 25 miles an hour velocity, and the few spectators were the principal reasons. On Sunday, however, usund people journeyed to the track, mar of them in automobiles, and despite a wind nearly as strong as that of the day before they were not dis-appointed About 4 45 P M Paulhan started against the wind, which was blowing directly acro His machine rose after a run of some 75 feet and traveled diagonally across the track while ascer-ing constantly at an angle of 15 to 20 degrees to a height of 300 feet above the trees on the opposite side of the track, then, turning around, it sped back with the wind, passed over the grand stand and, making a sharp turn, swooped suddenly th at the very point at which it starte utes before Paulhan's was the most thrilling exhibition of flight ever seen near New York, and it is unfortunate that a dispute with his manager has stopped any further demonstrations

On March is and 3nd Mr Heavy Parman made of some record flights with passengers with a new biplane. His machine was originally built for the Rheims meeting last August, but it did not fly then owing to an accident. Despite its small size and surface, it showed excellent lifting power and stability appears in 13 or 16 feet showers, besides having a large section cut sway in the center to accommodate the plane is 13 or 16 feet showers, besides having a large section cut sway in the center to accommodate the center out sway in the center to accommodate out sway in the center to accommodate out a sway in the center to accommodate out a sway in the center to accommodate out a extended of the upper plane only, and the call consists of but a single borisontal surface between the two halves of the upper plane only in the call consists of the upper plane only in the call consists of the vertical runder. The machine is mounted upon combined runners and skids and fitted with a lot H P Goome revolving cylinder motor. On the laft fine. Mr Parman made a flight of over its ginutes with Mim Parack and another passenger, thuy besting his three-person record of 10 35 made at Reharmy on August 28th, 100 The following day he again flew with two passengers and recentions alort fill and the content of the conten

### ELECTRICITY.

In September of least year the Boston and Mains Railroad established a telephone train dispatching system on the line between Boston and Flichburg. Mass This system proved so satisfactory that the railroad, is now about to equip two new divisions with telephone these the divisions consists of a similar line, from Concret to Wooderlin, N. H. and River Junicion. Vi.

In a lacture before the Engineering Society at Birmingham, Sir Oliver Lodge discussed the question of protection from lightning. He stated that the problem consisted in finding the best method of dissipating the enormous energy of the flash, but that twas now that to get rif of the energy too quickly A thin from wire is considered the best lightning conductor from the electrical point of view, but it is conducted to the electrical point of view, but it is not applied to the conductor of the electrical point of view, but it is uning this in the conductor of the conductor of the electrical points of the electrical p

Experiments made with ultra violet light app that it is more effective for sterilizing liquids than osone The ultra-violet light is produced by means of mercury vapor lamps quartz tubes being used instead by glass tubes which are placed in di rect contact with the water to be purified. A French investigator, M. Victor Henri, has found that th bactericidal action varies greatly with the distance of the lamp from the bacteria. With a Cooper Hewitt lamp of 110 volts an exposure of 300 seconds at a distance of 60 centimeters was required in order to kill the bacilius coli At a distance of 40 centimet ers an exposure of 180 seconds was sufficient, and at 20 centimeters 20 seconds. The temperature appeared to have little if any, effect for the microb were destroyed even when the liquid which contained In treating opaque liquids as milk it was necessary to spread the liquid out in a thin layer For milk the maximum thickness of Another investigator produces the ultra violet light by means of electric discharges in a rare re of carbon monoxide, carbo aulphureted hydrogen, or aulphurous acid

An interesting description of the rural telephone lines in the Ozarks was published in a recent humber of the Electrical Review and Western Electrician Every farmer in this region, no matter how poor has a telephone. The telephone lines have been installed by amateurs and every variety of teleph is used on them Owing to fear of lightning the ction from the pole line to the house wire is by bending the ends of the wires and hooking together. When a thunder storm approaches them together this connection is unbooked and it frequently hap pens that the owner forgets to re-establish connec tion with the main line after the storm. The lines are all grounded, making it very difficult for one party to call another Fifty telep considered a light load. The line ones to a line is The lines are supported on auch poles as can be easily obtained, which are sel dom sunk to a sufficient depth in the ground to prevent them from leaning at all angles. Trees are also used to support the lines and the branch are seldom cut away to clear the wires. However, the scribers appear to be satisfied if only their line The subscribers usually combine to but up a switchboard in the nearest town and pay some

A very interesting method of electropiating has sen developed in England. The metal that is to be deposited is mixed in nowdered form with other suband rub it on the surface that is to be plated other ingredients are an electro-positive metal, such as zinc or magnesium, an inert substance such as chalk, and a sait which when wet serves as an electrolyte The following description of the process is given by the author 'The electro-positive metal constitutes the anode and the object (reated the cathode, and as 'Gaivanit contains a quantity of finely powdered electro-positive metal it makes innumerable contacts with the cathode surface and acts as so many minute anodes. These innumerable minute anodes graduelly dissolve, and in dissolving set up in the liquid little local circulations of electric current The circuits are so excessively amail, so exceedingly near together, and so numerous that they cannot be sensrately obed, and the surface of the metal becomes seat of innumerable concomitant voltaic and electrolytic actions. Thus the potential or stored up energy of the elementary substances in the powder is converted into electric current, and as these currents leave the liquid they throw down from the metallic sait in solution a thick film on the cathode, and it plated over with a deposit

Prof. Lowell announces that he has discovered a new canal a thousand miles in length on Mars The canal developed between May and September last

It is stated that many of the library newspapers, printed twenty years ago are disintegrating because our modern wood pulp paper is not perman

The collection of Indian contunes weapons and utcasils brought together by E W Lenders of Phila delphia and valued at \$40,000, has been bought by J Pierpont Morgan and given to the American Museum of Natural History.

The astronomical clock at Hampton Court Palacehas been removed for repair and repaining for the first time for nearly thirty years. The clock, which was the first of its kind in England was made for Heary VIII in 1800. In 1800 it was brought from a shed at the balace where it had lain for nearly half a century, and by order of the Office of Works was re-erted in the position which it has since or capiled in the contrayed of the palace.

This count discovered by Daniel in December is not the same as one discovered in 1887, for which a period of about forty two years had been found. Than left counted has been found to belong to the Jupiter family of counted having a period of about six and a half years. There are now over thirty of these and four or five of them pass through peribelion every year, but they are in many cases so faint as to elude observation altogether.

W W Cobleats has discovered that one of the functioning of the imprehension of the milky shuld which the framework interesting the milky shuld which the first interesting the milk shuld which the first interesting the interesting them is it as a superior except the milk as a function of the function of the milk as a function of the milk in which have lengths are measured as a function of the milk in which have lengths are measured to the milk in which have lengths are measured to the milk in which have lengths are measured to the milk in the milk in which have firstly which the firstly white a function of the milk in the milk in the milk in a post time and from \$10\theta\_{p}\$ to \$70\theta\_{p}\$. Hence the two spectra are mutually combinementary.

In the sorthern part of Archangel, which is the most northerly government of European Russia a farm to the breeding of Kamecharks ofters blue focces, sables, martens, and other valuable far bearing animals is being established by German capitalist. The soil and illuster of this district are exactly sailed to the animals and the annual result charge is only about 5 cents per acre, so that the centure appears very promisting at five glainer in the other shade a large initial outsity is required. The farm which has cost \$67.000, but the bury configuration of the control of

P Soddy finds that the growth of raidium proceeds recording to the source of the time. On the assumption that no other intermediate bodies intervent the period of the direct parent of raidium is 17500 years. The amount of raidium present in the last prepared notition is less than that to be expected, this suggests the existence of at least one new product. Urnaisan it is concluded that this would not appreciably after it is concluded that this would not appreciably after the production of raidium according to the square of the time over the priod other protons have been made, the time over the priod other protons have been made, the proton observations have been made of the average life of the parent of raidium according to the Rutherford formula.

A German bird fancker has made a series of experi ments for the purpose of determining the vitality of eggs in different stages of incubation. On the fifth day of incubation five conary birds a ggs were inken from the next, marked with numbers and replaced in the next, one by one at half hour intervals. This ent was repeated ten times with as many clutches of eggs. As a rule the first three eggs replaced batched normally and the two others failed to batch. Hence it may be inferred that the average longevity of a canary bird's cags taken from the next on the fifth day of incubation is 15, hours same way the longevity was found to increase to 2 or 2½ hours on the seventh day and 3½ to 4 hours on the ninth day of incubation—It was discovered by accident that eggs in a very advanced stage of incu bation can endure very much longer periods of re moval from the nest. Two eggs, purchased as picy er's eggs, in the course of an excursion, were si er's eggs, in the course of an excursion, were accessed in a basket, brought home and forgotten. On the evening of the following day a faint "peep 'recalled the existence of the eggs and it was found that a young suipe had issued from one of them. The secoon made its appearance but lived only an hour Hence it appears that the vitality of partly hatched eggs depends on the size of the bird as well as on the stage of incubation.

# An Account of a Trip in the Largest Balloon Ever Constructed

A BALLOON TRIP OF FORTY YEARS AGO.

It is doubtful whether the sensation of travelling in an airship has ever been better described than was done forty nine years ago inst Jun by Garrik Mailory and published in the Philadelphia Inquirer, June 38th 18th 6 fatr a voyage in the largest airship that had ever been constructed up to that time Mr Millory was a gentlim and education and fine

Mr Mallory was a genil man of education and fine descriptive tained and intercommanded a brigade of savairy during the civil war. Prof T S C Lowe, the aromati in charge has a distinguished civil war record as an aerial secul. He is constructing a great moistr a sirvily in his bosse city, Pasadena, Cal Hro is Mallory a secount, somewhat abbreviated "The ascent of Mr Lowes mammoth strainly on

The sacent of Mr Lowe's manimoth sirable on Thursday last was by no means an ordinary occasion Sol-disent scientific aeronauts had in treatuses and speeches positively demonstrated that it could not finant Accordingly, when on the ground, we

with beset with gratuitions advice from self-constituted professors and aimosphic voyagers to the offset that it was madness to risk the untried experiment, and as to our friends we were ridiculed, threatened, eagloid, brited, and wopt over by turns

"So we held a council of war with ourselves in a temphod rool reason and positively could not see why as increase of especially in a balloon must necessarily diminish its efficiency, or that a greater range in the amount of gas to be evolved on the occasion, and in the number of sand bags to be retained or thrown away according to the object of ascent or descent, stoud destroy control over the element to be navi-

"The few mont ropes are held by atrong arms, the enterprising workman who seems to desire an accent on the edge of the basket is induced to set down and put a bag of anal in his place, the other two gentlemen who determine at the olevanth hour to acquire serial honors scramble in when the swyling has begun, the last dying speech and confession has been made, all lated bying speech and confession has been made, all because the series of the series of the series of the bowever, in the alightest degree. There is no motion perceptible, and we conselves are outlively stationary Bosschilar to be sure is the matter with the field it has dropped Perhaps that is the reason why the cowed down below there is matting such a noise. They

LOWE'S DIRIGIBLE BALLOON.

are frightened, most probably To be sure, they have some reason. For it is a rather alarming occurrence for the soil earth to fall down in that way, especially when all nature is so caim, and the sun shines so happily, and our car is so nice and fixed So we feel badly about our unfortunate fallow beings who are momentarity becoming smaller. Suddon't, a villiant idea

seizes us that we have actually begun the great ascent, and we forthwith begin to wave the flags and hurn's hand jump No, we don't jump, for there isn't room, but we would it we could. The mites down below give cheer after cheer responsive, and run futilely in our course, and we fly away.

our course, and we sy away.

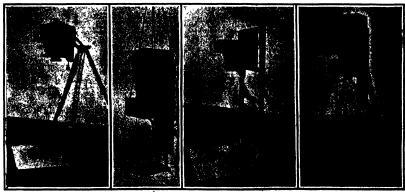

"Although nothing could have been easier than to have risen immediately to a great height, yet as the lower breese was northerly and light, we purposely remained in it, as thereby a deliberate view of the city mained in it, as thereby a deliberate view of the city. and its environs was presented that could not be hoped for once in a thousand times. We had precisely the day, the hour, the current, and, above all, the balloon sented that could not be hoped calmly on, silent, and ravished with extrasy At the altitude of three thousand feet we look down fondly on Gray's Ferry, Darby, and the park, somes of our equestrian pleasures, and then turn to the sparse houses of somi rural Moyamensing, picturesquely isleted in green lakes and foliage. Next we glide on over the great city, seeming to the asleep in that soft summer evening, with never a breath to disturb its happy rest, save the vague murmur of life which s upward toward us, like the distant hum of invisible apware toward us, like the distant num or invanise insects. We are higher now, and to the naked eye vast buildings like the Continental are distinguished otherly by their known position, but as we pass along, the streets radiato on all sides with mathematical exactness, bordered with faint green lines of foliage. The public squares are patches of verdant enamel, and the spires point up at us with the beams of the sun shining from their whiteness until they only can son summy root to the hear-frost appearing on a window in winter Far away Girard College is discorred in the distance as a nathlil of marble dust, and Fairmount is found in a fairy toadstool, with the Schuylkill curving close to it like a sliver thread dropped, perhaps, from the robes of Titania herself But it is perfectly in vain to attempt any description of this most exquisite scene, which naught but the colors of the most gifted could pretend to convey to any who have not gitted could pretent to convey to any sun have not beheld it Indeed, it was all to us but as seeming picture seen in an enraptured vision. There was no reality about it. We were real, and the car, but every(Continued on page 360)

# VERTICAL PHOTOGRAPHY

BY CHARLES MONROE MANSFIELD

In recording scientific material, whether plants or their fruits, or any peruliar material of which a record in picture is valuable, the exact size is slways desirable. Various apparatus have been constructed to support the camera and hold its subjects, but the real servet lies in the focus of the lens. Any subject placed twice the focal length of the lens from the iens, and the iens twice its focal length from the focal plane, will give a picture natural in size For example, a blue-luch focus lens placed eighteen linches from the subject and the focal plane the same distance from the lens will give a natural size image in focus on the ground glass without further adjusting the sames.

Nearly all actual size work is done vertically. This gives the operator the privilege of maniputating his funder ground during the exposure without interfering with the subject. The object to be photographed in smallly pilect on a glass support, which may be either plain or ground, and the back or under (Conciledon on page 287)

# AN INTERNAL COMBUSTION WATER PUMP

THE INGENIOUS INVENTION OF H. A. HUMPHREY

Wifespread interest has been aroused in European engineering circles in a new type of pump that has been evolved by a well-known English engineer, Mr

H. A. Humphrey, M. Inst, C. E. It is hased upon an an tirely new principle, and is a revolution-ary departure from existing practice, the novelty of the design compelling as much attention as

The pump is mental principle of internal explosion, but does away with ing parts of a gas engine, such as the piston, connecting rod, crankshaft, fly wheel, two-to-one moving parts what ever except the sim-

mushroom INTERNAL COMBUSTION WATER

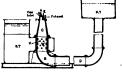

and close automati-cally, due to pressure changes, and the use of a fiy-wheel is not necessary because a column of water, forming part of the water pumped, acts as a recipro-

cating flywheel. The water column, which also acts cating nywheels are water commin, which allow alone as a piston, has four unequal strokes, such as theory requires when expansion is carried to atmospheric pressure. These strokes comprise long strokes during embustion and expansion as well as during exhaus a shorter stroke during suction, and a still shorter stroke during compression. There is no valve across the discharge pipe at any point, so that the water has a perfectly free passage from the explosion chamber to the high level tank.

The explosive mixture of gas and air is ignited, as in the ordinary internal-combustion engine, and in contact with one end of a column of water which ful contact with one end of a column of water which ful fills the dual function of piston and flywheel and moves so as to draw in a fresh combustible charge, to compress this charge previous to explosion, to permit expansion to be carried to atmospheric pre-sure, and finally to exhaust the products of combus-All these movements are brought about and con trolled by changes in the momentum, which occur naturally in the column of water itself In order to explain the cycle of operations in a

the simplest type, a reference to the accompump o the simplest type, a produced. The pump panying diagram will be found useful. The pump to built up from three main castings. There parying diagram will be found useful. The pump proper is built up from three main castings. There is the combustion chamber  $\theta$ , the water vaire chamber  $\theta$ , and the bead  $\theta$ , which connects the pump to the discharge pipe D, leading to the clowards tank  $\theta$  TThe suction task  $\theta$  T is extended to ambrave the valve-box chamber, as shown, so that there is free access of water to all the water valves  $\theta$  T The last access of water to all the water valves V The last are plain mushroom valves, opening inward, and held on their scating by light springs In the top of the combustion chamber is an inlet valve A, as well as an exhaust valve K Arranged between these two valves is a simple interlocking device, so that when valves A has opened and closed it locks itself shut, and releases valve E, and when valve E has opened and sequently, each time suction occurs in the chamber e valves open in turn.

For the purpose of demonstration, suppose a gaseous charge is compressed in the top of the combustion chamber C, and is ignited in the usual manner by the sparking plug, which projects through the top or head of the combustion chamber. All the All the valve are shut at the instant the charge is exploded, and

SECTIONAL VIEW OF INTERNAL COMBUSTION PUMP.

the increase in pressure resulting from the expand gases forces the water downward in the pump, and sets the whole column of water in the bend B and dis-charge pipe D in motion The column of water attains kinetic energy while work is being done upon it by the expanding gases, so that when those gases finally expand to atmospheric pressure, the column of water may be moving, say, 6 feet per second. The motion

# RAPID TRANSIT BY BELT CONVEYOR

### A PROPOSED AMPLIFICATION OF NEW YORK'S SUBWAY

The method of rapid transit by means of continuously moving endless platforms has never as yet re-ceived the attention which its unquestionable advantages deserve, for, within certain limits of speed, it possesses a capacity for carrying passengers which is possesses a capacity for carrying passengers when as so far beyond that of any existing system as to place it in a class by itself. That the system has not been put into practical application in the solution of those problems of congested city traffs for which it is so admirably adapted, can only be explained by the exadmirably adapted, can only be explained by the ex-treme novelty of the method employed, the inertia of that deep-rooted conservatiam, which, even in this atteity utilizaria mape, exerts such a powerful con-trolling influence on buman affairs. The construction and operation of the moving passenger platform is so simple, and its great carrying capacity is so obvi-

ous, that its advantages are readily perceived even by the layman who may have no particular mechanical aptitude or training, and it is certainly significant that the proposal to equip a sec-tion of the proposed New York Subway with a moving platform has received the informement of such men as Henry B. Seaman, the Chief Engineer of the Public Service Commission, and of Mr. L. B. Stillwell, the electrical engineer who was responsible for the electrical who was responsible for the electrical equipment of the Elevated Ralironds and the New York Subway system. Interest in the proposed moving plat-form has been recently revived by the recommendation of the Board of Estimate of this city that a moving plat-form be installed in a subway extendform be installed in a subway extending across Manhattan laiend from the flast to the Hudson Sitrey below Thirty-fourth Sitreet, and on the front page of the present lessue in a sectional limitaristics, which shows the subway said of the moving paintorn such as the subway said of the moving paintorn such as the subway said of the moving paintorn such as the subway said of the moving paintorn such subway subway

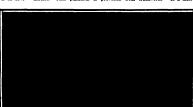

way and of the moving platform itself.

In those branches of our industries, for the economical operation of which it is absolutely necessary that material the conveyed from place to place at a maximum speed and with a minimum one, it has emailted there in one system of transportation which so perfectly fulfills these conditions as the but caveyor Particularly is this true where a great particularly in the true where a great bell of material, constitute of there are feel of difficult with a material constitute of these or less flashy difficult within such as coal, iron one, and when, the to be moved in great emantities with a stitle interests to the material of the material of

runtion as possible and without any manipulation by hand In this system, an endle it moves contin ously in a given direction, and facilities are provided for loading the material on the belt at any desired for loading the material on the belt at any desired point and for unleading it therefrom at any desired

point of delivery

The moving platform is no a huge best conveyor, in which the material to be conveyed consists of the teeming millions which consti veyed consists of the teening millions which constitute the passenger traffe of a great city, with pre-vision for loading the passengers at any point through-out the length of the platform and unloading the while the latter is in motion. The train consists of short jointed platforms, coupled together and form-ing an endless chain which is kept in continuous motion. This platform is provided with transverse motion. This platform is provided with transverse

View of the method of driving the platforms by means of stationary electric motors and differential rubber-tired wheels. RAPID TRANSIT BY BELT CONVEYOR.

seats, and if travels at a continuous uniform speed of trevier miles per hour. For transferring the pas-senger from the fixed station platforms to the seated platforms, there are introduced between them three narrow "loading platforms" which more at differen-tial speeds. The first of these adjoining the station that special, rule risk of trokes acquiring the state of platform moves at three miles per hour, the next at six, and the next at nine miles per hour. The passen gar who wheles to board the rule, faces the direc-tion in which it is moving, steps onto the three-mile-per-hour platform, and, creating the other two possitively, takes his seat. The suscess of the somlator or moving stairway, of whith many operation throughout the country, removes any doubt of passengers being able after a little practice to accommodate themselves to the speed of three miles an lator or moving stairway, of which many are now in hour involved in boarding the train

The advantages of the arrangement as summed up by the Chief Engineer of the Public Service Commis-

sion are as follows

1 A vastly increased capacity, and seats for all

There is no delay incurred by waiting for trains at stations, as the train is always there and co

stantly moving 3 Passengers may board or leave the train of any

int at will, and instead of placing stations of of a mile spart, as on the present Subway, they may

be placed at every cross street, or in-deed at any intermediate point, and the construction may take the form of a continuous arcade

In its general construction the tun nel would be similar to those built for the ordinary Subway traffic. It is proposed, however, to build an ader throughout its length, with store win ous promenades between them and the ous promenants between them and the barrier separating them from the Sub-way platforms. At each street cross-ing, and if it be desired at one or more points between them ticket booths and turnstiles will be installed an arrangement which would permi passengers to source the curs practice cally at any desired point throughout the length of the subway.

The arrangements for driving the platform by electrical power are as follows:

lows Extending longitudinally be-neath each platform is a pair of I-beams, the upper flanges of which are riveted to the

bottom of the platform, while the lower fianges serve to support the weight of the platform upon pairs of wheels, which are carried upon transverse shafts mounted at intervals of 2 feet 9 inches, upon concrete piers, as shown in the engraving Between cuch pair of longitudinal I beams is carried a pair of horizontal guide wheels which engage a guide rail that serves to keep the platform in proper alignment At every 76 feet, 10-horse-power motors are mounted on the floor of the subway, and are connected by a chain drive

## COMPENSED FACTS ABOUT HALLET'S COMET.

A few facts presented in a condensed form may possibly interest the readers of the Beystiet AMERI CAN who wish to follow the course of Halley's comet in the heaving during its press at annear

forward of the base of the foremast.

The position of the 6-inch battery, with a protection of 8 inches of armor below and 6 inches in front of it, must be considered vor, satisfactory, although the protection is not equal to the 9 inches afforded to the 5-inch battery on our latest ships. Excellent also is the protection of the smokerstack to a height of 18 fore above the war deck by a smokel sheet halter. of 15 feet above the spar deck by a special steel plate 1½ inch in thickness. The following particulars taken from The Standard

Buenos Ayres, will be of interest The main armorelt will extend for 250 feet in the center, and 4 feet 9 inches above and 3 feet 4 inches under the normal water line, the uniform thickness being 12 inches The armored band will extend 75 feet toward poop and bow to the barbettes, but with the this knes of 10 inch only Above the principal belt of armor for the whole length of 400 feet there will be armor of 9 inches in the lower part and 8 inches in the upper part to the height of the main deck. The bow and poop will also be protected by armor of 6 and 4 inches respectively On the main deck there will be a casemate with armor of 6 inches, in which the 6 inch guns will be The bases of the chimneys will be protected to 15 feet from the deck with a special steel plate 11/2 inch thick The total weight of the armor, barbet inch thick The told wight or the armor, parories, turrets sit. will be 7,000 toins The bottom of the ship will be protected against submarine mines with 680 tons of nickel steel. The turbine engines will be in three separate and independent compartments, and in three separate and independent compartments, and the bollers will be in six compartments, divided into two groups. The capacity of the coal bunkers is 4,000 tons and there will be tanks for 660 tons of potroleum. The turblines will develop 39 500 horse-power. with 25 millimeters of pressure of air in the boilers with 25 millimeters of pressure of air in the boilers. This, with a displacement of 27 500 from, will give a speed of 23% miles an hour for eight successive hours. With this speed the radius of action will be 3,500 miles, at a speed of 15 miles the radius will be 7,200 and with 11 miles an hour 10,100 miles. The cost of each ship will be \$11,000,000

### THE SCIENTIFIC AMERICAN PLYING MACRINE TROPET

CONDITIONS FOR 1910

The Scientific American Trophy for heavier-thanair flying machines was offered by the Scientist American for annual competition under the rules and regulations formulated and promulgated by the Acro Club of America in 1907

Club of America in 1997
The first trial for this cup was held at Hammondsport, N Y, on July 4th 1998, by the Aerial Experiment Association of Hammondsport N Y The minimum distance to be covered was one kilometer (3,280 feet) The trophy for 1908 was won by Glenn H Curtiss in the "June Bug," he having made a fligh of 5 000 foot. This was the first official public flight for a record made in the United States

The trophy was also won for the year 1909 by licen H Curtiss, who on July 17th fulfilled the new conditions of the competition for that year by co ing a minimum distance of 25 kilometers. The actual distance covered was 25 002 miles in 52 minutes 30 which was considerably in excess of the mini

mum distance required

Both of these trials were made under the supervision of the Contest Committee of the Aero Club of America

cordance with the deed of gift which pro In accordance with the deed of gift which pro-vides that the conditions for each context for this trophy shall be made progressive in their severity of test in conformity with the progress of serial navi-gation, the conditions to be fulfilled by the next per-son entitled to have his name piaced on the trophy shall be a flight of not less than 46 miles across country The contest for 1910 must be held within the United States.

## RULES COVERNING COMPETITIONS FOR THE SCIENTIFIC

AMERICAN TROPHY FOR 1910

I The trophy is to be the property of the club and not of the members thereof, except in the event that any one person shall win the trophy three times, in which case it is to become his personal property Bhould the trophy be won by the regressrative of some foreign citch amiliated with the Aero Cicle of America through membership in the Interpational Aeronautic Federation, it shall be held in the castody of such club, but it shall be schiect to competition

under the same terms and conditions as if it were still held by the Aero Club of America. Should the holding ctub, for any reason, be disbanded, the custody of the traphy shall revert to the Aero Club of America. Should a contest or trial under the rules not be held within a year from the date on which a foreign com peting machine shall have won the trophy, the foreign

peting machine shalt mave went the tropus, the correspondence of the cup shall give up its custody of the same and shall return the cup to the Aero Club of America, in order that the competition or trial for that year may be held in the United States of America

The conditions under which the competitive tests and trials shall be made shall be determined by the Contest Committee of the Aero Club of America and such conditions shall be made progressive in their severity of test, as far as possible, in order to foster and develop the progress of the art of aerial naviga

All heavier-than-air machines of any type what ever (aeroplanes helicopters, ornithopters, etc.) shall be entitled to compete for the trophy but all machines carrying a balloon or gas-containing envelope for pur poses of support are excluded from the competition

III In order to compete for this prize the con testant should file with the Auro Club of America a formal entry, addressed to the club at its headquar-ters in New York, declaring his intention to compete for the trophy Whether the trial is to be made at

THE SCIENTIFIC AMERICAN FLYING MACHINE TROPHY.

a recognized aeroplane meeting or at a special trial, the contestant should indicate the date upon which he seeks to make a flight. He must also deposit the amount of the fare from New York to the place of trial, and return

trial, and return
A reasonable time must be allowed for the representative of the club to reach the place where the
dight is to be held. If the trial is to be made within
25 miles of New York city, the amount of the fare
will be defrayed by the club. In case the Contest Committee find that the place of trial is too far dis committee and that the place of trial is too far dis-tant, and they are unable to arrange to have an offi-cial present, the confestant may be required to hold the trial at some convenient place mutually to be

IV The person or committee having charge of the test or trial shall make careful measurements of the distance covered by the flight, and shall prepare a distance covered by the flight, and shall prepare as written report of the less or trial, which shall be delivered to the Contest Committee of the Aero Club of America, and in such report shall state fully whether in his opinion the machine can be handled whether in his opinion the machine can be handed with safety, and, as far as possible, be shall determine the speed attained during the flight. He shall also take into consideration the question of atability and cases of control, and he shall state in his report weather

The flights will be made in as calm weather as

possible, but the contest committee or its representa-tive will at its discretion order the flight to begin at any time it sees fit, provided the velocity of the wind does not exceed twenty miles an hour. The ma chine may start by running on the ground or upon a track under its own power, but no special launching device will be permitted. There is no requirement as to the height above the ground at which must fly

VI Complete specifications of the competing ma-chine, giving weight, supporting surface and power of engines together with a description of the best trial of the machine, shall be forwarded to the Con-tost Committee at or before the time of making entry

for the contest.

VII The trophy shall be awarded for the year 1910
to the contestant making the longest cross-country
flight during the year. The distance covered must be

at least 40 miles as the crow files, or to a point 20 miles determined to the point of departure. The trophy shall not be awarded unless formal entry for the same has been lodged by the bona fide. owner of the machine with the Contest Committee of the Acro Club of America in accordance with the conditions elsewhere specified. The name and record of the successful contestant shall be appropriately inscribed on the trophy
VIII All tests and trials shall be under the off-

cial supervision and direction of the Aero Club of America, and all questions that may arise in regard America, and all questions that may arise in regard to such contest or trial shall be decided by the Con-test Committee of said club, and its decision in all questions of dispute shall be final, and without right

of appeal to a court of law or equity
'X In case the Contest Compiltee is unable to de
ermine which machine has made the best perform
ne during the year 1910 it shall arrange that a com tween such machines be held, and the ma hine making the best performance in such test shall

varied the trophy for the year

No trial or test for the year 1911 will be allowed until the rules governing the competition for that year have been promulgated

## The Current Supplement,

W P Dreapers excellent consideration of the artificial silk industry is concluded in the current Burris-MENT, No 1786 Attention has been again directed to the possibilities of radium as a curative agent by Sir William Ramany and Sir Lauder Brunton For n an article on the subject in the current SUPPLEMENT should be read with interest Lucian Fournier describes the freezing process which was em-ployed in the construction of the Paris Subway The case of Wright versus Paulhan, and some extracts from affidavits and Judge Hands decision in the case of the Farman and Hieriot acroplanes is concluded H. Thurn writes on airships, wireless telegraphy, and atmospheric electricity Most interesting is an article by T Kume on Japanese pearl culture, in which he considers the pearl historically in Japan, mentions the Oriental bivalves which produce the best pearls, and then describes in detail the method employed by Miki moto for the artificial culture of pearls ments on the expansion of air by heat are describ Automobilisis will read with interest an article on a variable stroke gasoline motor Prof T J J See contributes a thoughtful paper on the origin of the lunar craters, in which he endeavors to show that th wonderful craters may be explained by the impact of some sort of projectiles W Nernst contributes an article on general and physical chemistry in the last

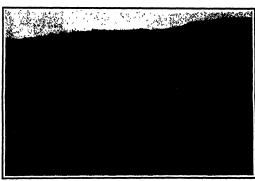

A NEW TELEPHOTO CAMERA BY THE PART CORRESPONDENT OF THE MISSIPPE ARESICAN
It may seem far casier than it is to construct a It may seem far caster than it is to construct camers which will give an onlarged image so as to bring out the details of objects at great distances. To give a large, image a long focus is not in required, of four foot focus for casmiple. But a camera to use this lens must be of vry great length and weight, and cannot, therefore, be said to be portable

In the instrument illustrated which was designed on the Vantier Dufour and Scha system, the inventors on the youther Durfour and Schä system, the inventors have solved the problem on prescribe the focal length of the lens and at the same time reducing the volume and weight of the apparatus by cutting the formal length into thirds with the attle of two milrors. At O is the lens which lies in the upper part of the double how fire this passing through the lens are reflected from the upper mirror M placed at the back of the box to the mirror M' at the front end of the lower section, and thence to the usual ground glass P section, and there to the same a camera of sixtees inches length is sufficient for a lone of four-foot focus, with an evident assing in weight and reduction of volume such an instrument is quite portable. The upper part Such an instrument is quite portable. The upper of the camera is made on the extensible plan, s drawn up and out of the lower box when the photo-graph is to be taken

Up to the present time the different combinations of lenses for telepholography have all had one great fault namely, a want of luminosity and consequent difficulty in focusing It was almost impossible to the such lenses for snap shots. The camera illustrated takes instantaneous views in the usual way. The

The city of Neuhausen and the Rhine Falls taken with an ordinary camers

as opening is always in ratio with the focal length ions opening is always in ratio with the focal tengen of the lons, \$10 to \$12\$ for the outer rapid. The luminosity is thus always sufficient for instantaneous work. For the photography of inaccessible places, such as mountains or details of architecture or scenes. in which the interesting spot is at a great distance from the observer, the new camera performs very good work, as will be noticed in some of the engravings presented here. In a balloon the new system renders it possible to take rapid instantaneous views which would be impossible with an ordinary teleobjective Such views are very difficult to take, not only because of the distance of the objects, but because

of the objects, but because of the continual move-ment of the balloon, which makes rapid anap-shots necessary Snap-shots can now be taken up to 1-1,000th

second which would be quite impossible with any tele-lens with which we are ac-quainted. At the full open-ing the present lens gives pictures which are sharp up to the edges of the plate. The present camera has already undergone trials in a first believe on board the

years ago, that "by the superior skill of his right hand man hath gotten himself the victory" in the svolutionary struggit. To try to undo his dextral pre-eminence is to make for devolution. Glimpses of

right-handedness in man, it seems, and are manifact in the bronne age and in Palsolithic times. It is ordent in the art of the act of the ancients—Assyrian Oracian, Rigputan Historic Investigation shows that all peoples, however savage, have uniformly used by preference not only one but the same preference not only one but the same races to-day manifest, either handed near, but this is in the last degree doubtful Sixch statements have, for example, been made concerning the Japanes—that they are by law and practice emblet-irous. But Baron Komura has given positive assurance to the continy für James believes to the continy für James believes to have been been better the statement of the continy of James believes any fully developed and civilized hu man beings, though sometimes verure.

Most human beings, then, are righthanded, though of course, there are those of great intellectuality and force who are ambidextrous having educated themselves to this end, and are exceptional by reason of the peculiar and special training they have undergone. The origin of right hand

undergone The origin of right hand ednoes will be found, i believe, to lie much deeper than the individual's voluntary selection whether he will use his right hand or his left, or whether he will be ambidextrous, the reason is to be found in human anatomy—in the position of the heart, and in the cerebral structure and organization by which latter all voluntary movements are directed and controlled Consider in the first place how the heart and its

The Parthenon taken with an ordinary camera.

great arteries are left-sided, though in the primor dial organism from which we have evolved there was, it seems, no such symmetry. The savage, from time immemorial, has protected his heart with

his left, his shield arm, but his aggree but his aggres-sive manipu lations are made with his right, his spear arm The modern anvage though too h e bears 'nо shield — which would be use-less against modern weapons - fires his musket uni formly (in a double sense) from the right shoulder, sighting with his right eye, the sword also .oe right hand %

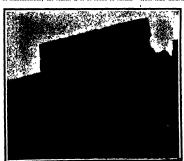

Again, in obs dience to the universal next for barter—so Dr Ooude points out—the primitive practice was counting with the low numbers, one to the free dexiral hand were first used, and all fingers are new called digits, as are the figures them selves, and the basis of our numbering is the decimal or to fin greed system. The second impor

The second important fact in human anatomy is that all our voluntary movements are directed and controlled in the cerebral structure and organization. The brain has two hemi spheres, of which the right presides, by means of certain de-

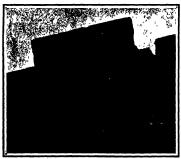

cussating nerve fibers, over the left side of the body, while the left brain presides over the right side. And fluctional differences in the two sides are connected with and contingent upon differences in the two heart where The left brain, in all right

An extremely important austomical consideration is that in right-handed people the "speech center" is situated in Broad's convolution in the cortex of the left frontal lobe, while in left-handed people the speech center is in the same position, but in the right frontal lobe Now It has been found that damage to Broad's convolution in the left hemisphere deprived the right

handed man of speech, which is unimpaired in the left handed man under the same circumstances, the left handed man would suffer in the same way, were (Continued on page 288)

# THERMAL TREATMENT OF STEEL INGOTS

## BY J. F. SPRINGER

There are two considerable imperfections which ac company the cauting of steel ingots. The more conspicuous one is that of the pipe. This is a conteal cavity which forms in the upper portion. In Fig. 1 we have in the center two longitudinal slabs taken from steel ingots which nothint the pipe very.

from site I ingoins which eachbil the pipe very cheart. In mound explanation of this curtous formation regards it as a consequence of continuous and the continuous and the continuous and the continuous and the full when the ingoin has cooled off. There is in fast a columeric loss of perhaps the continuous and the full when the ingoint has cooled off. There is in fast a columeric loss of perhaps the continuous and the continuous

substantial character of those shown in Fig. 2. Their couling effect is consequently a Fig. 2. Their couling effect is consequently a Fig. 2. The couling effect is consequently a fine cooling linguit will constitute a shell conformation to the sides and bottom of the moid and containing a heavy mass of motion steel. Now, shelter expansion or contraction takes place at the very moment of freezing, the sites of this shell will undoubbelly steadily contract As this goes on, it meets resistance from the weight of the liquid within the properties of the second of the second

To climinate the pipe many procedures have been employed. These divide the mis-less into the mechanical methods and thermal ones. Perhaps the most auccessful process with than yet found fits way into comparing the procedure to the Harmet procedure described in an article by the author in the RED NOTHER AMERICA. 1999 Methods, such as this, operate

with a view of eliminating the pipe through the foring in of its walls upon themselves while the interior of the ingot is in a liquid or plastic condition. The elaboratoness of the apparatus necessary, and the length of time required, are serious considerations.

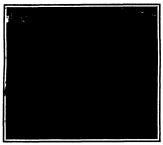

Fig. 1 —The six transverse siahs and the right-hand vertical siah were poured by the hot-top process.

which operate against some, at least, of the mechanical processes. But offers have been made to solve the problem by thermain mean. If the steel at the operation by thermain mean. If the steel at the operation of the inget becomes solid, then with such a reservoir perhaps the pipe could be progressively filled up at the formed. Upon some uset fundamental idea the the mail processes depend Krupp is said to have poured motion size upon the tops of the ingets. Apparently

Fig. 8.-- "anveur's overflow method of pouring ingots.

but Hitle is known of the measure of success. This might, private a provide a good method. The angist, private a provide a good method. The over specific arrange of the private provides and the private private provides and the private private provides and up, the pipe will be reduced. In fact, a very considerable shortening has been accomplished in this

way Experiments have been tried where the metal was steel, rinc, and waz. All show improvement No doubt this effect is due to the retardation of the cooling thus effected at the top by the provision there of a larger mass of metal. That is to say, the pipe is shortened if cooling is accomplished from be-

shortened if closing is accomplished from betow There is, however, a storag objection
tow There is, however, a storag objection
reduced, the pipe is also because its breach
and thus involves more metal in preportion to its length. Its corrective influence is thus discounted somewhat There is
another objection on the acore that this
method would involve complications in stripping the molds from the inputs. However,
the method would involve complication in stripping the molds from the inputs. However,
the thing the control of the compound by
means of a rod into the upper portion of an
inger, the pipe could be somewhat shortened
This result is, no doubt, due to the considerable heat set free upon the chemical reaction
believed the result in the same direction an
account of these experiments with wax in
gots carried out by Prof. How and Stough
ton give evidence in the same direction an
account of those experiments may be found
in an article by the present writer in the
Scinnytz Ansata Ay for Agril 24th, 1969,
where the marked differences in the length of
where the marked differences in the length of

4 and 5. In the cases of Ingota Nos 8 and 7 we have the centrast realized by keeping the temperature but at the top and cool at the bottom and vice cross The difference measured in percentage of ingot preserved from piping amounted to 48 per cent This devantage of nearly one-bulk the whole lingot was in favor of the hot top. Of course, these superiments favor of the hot top. Of course, these superiments favor of the hot top. Of course, these superiments favor of the hot top. Of course, the superiments favor trind with sized by what may be called the overflow method This is Prof Sauvour's process. A number of molds were arranged in a way not unlike that disclosed in Fig 2 Dy pouring continuously into the one on the left all may be filled I twa thus found upon one or more overaloss that the first and second ingots whose heads with liquid supples of sized, chickeded no pipes. The next two had small pipes, involving about 4 or 5 per cent of the taget kingth.

Now all these experiences prepare us to expect a decleded surcess from the Rimers bot lop process as used in Gormany. This insertior applies a gas furnace to the ingot top. Apparently, however, others had had a similar idea. It would seem that their processor it caved but inconsiderable attention. Now Riemer not caved but inconsiderable attention. Now Riemer not caved but inconsiderable attention. Now Riemer and Further, he provides an immerse experience at at 10 Further, he provides an immerse experience of a creat over the top. However whether we understand why it should seem nevessary to the formation of a creat over the top. However whether we understand that the provides are inconsistent of the provides and the provides are understanding in great amount but with great promptness the fact Concluded on app. 300 1

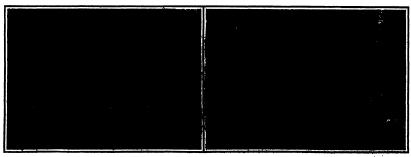

Fig. 2.—Gas furness is here being used to probast the mold before pouring. Fig. 4.—Gas furness in operation beating the top of a Sédon ingot while metal the large.

# EGGS OF CURIOUS FORMS

## BY PERCY COLLINS

When we consider that with the exception of the class manualis, practically every creature dwelling upon the sent hat the present moneson began life except the sent of the present moneson the part of the sent o

whose habits comparatively little seems to be known, save that they subsist mainly on insects, and that they really do lay eggs.

My do more detailed accounts are extant respecting

Much more detailed accounts are extent respecting the habits of the duck bill Oratiforhynk-kes persource (as science terms it) is not unlike a gianute mode in shape, save that it possesses a remarkable tail and feet and bill of duck like design. Its habits closely resemble those of the common water rat. Frequenting the streams of southern and ceatern Australia, it makes it as burrow in the bank Here Mother Duck-bill lays two white, factible-boiled eggs, about three-quarters of an inch is length When girst about three-quarters of an inch is length when girst source and the state of the size of the si

hatched, the tiny duck-bills are both blind and naked, but in process of time they acquire the adult characteristic, and issue from the nest hole to feed and frelic in the river with their parents

Leaving now the mammalia we find that all known birds lay eggs, the largest being that of the ostrich Many of these eggs come from Africa, and after being stratched, painted. "poker worked" or otherwise adorned, are used for decravity purposes. Thus we are all familiar with them, and can resilise that the contents of one would form a bountful meal But the ostrichs sork would have appeared quite small be-Confision of the contents of the conten

# CURIOSITIES OF SCIENCE AND INVENTION

### MOTOR-CYCLE AUXILIARY FOR BICYCLI

A power attachment for bicycles has recently been invented which calls for no structural alterations to be made in the ordinary bicycle and which can be attached or detached in a few minutes The device comprises a small auxiliary when 20 inches in diam eter fitted with a light motor which is connected to the rear wheel of the bicycle. An ingenious pivoting

A POWER ATTACKMENT-FOR BICTCLES.

arrangement allows the wheel a poculiar lateral and vertical movement, so that the steering of the ma thine is in no way affected and permits the wheel to gitde over obstacles or rough ground without trans-

gives over contactes or rough ground without ran-mitting any abock or vibration to the rider. The motor is a small air-cooled, bertsontal, two-stroke engine with a specially designed but to which the power is transmitted through a six to one reduc-ing goar. The magneto ignition and vaporiser are mounted on the same plane, and in line with the co-

ing goar The magneto ignition and vaporitar are monated on the same plane, and in line with the engine, so that the whole is rendered very compact. The engine is valveless, the indict and enhant being governed by ports, alternative curvered and uncorrect the property of the control of the control of the property of

## A ROYAL HIGH-POTENTIAL PRIMARY BATTERY.

A new and ingenious high potential primary battery, the purpose of which is to supply electric charges at known potentials, was recently exhibited before the English Physical Society The positive element of each cell consists of a small carbon rod, while a strip pure sinc comprises the negative element, the ele-siyte being a solution of calcium chloride of pure si

The connected ends of the elements, which are counted in parallel rows of 25, are buried in paradin.

A HYGROSCOPIC HIGH-POTENTIAL BATTERY.

CARBON BLEMENTS.

is just broken by a small pellet of parafin, and the liquid is retained between them by capillarity

itude is retained between them by capitarity
The electrolyte comprises a saturated solution of
calcium chloride which has been exposed to the air.
Being bygroscopic it will absorb water until a cartain equilibrium strength is obtained, this factor depending on the humidity of the air and the temperapending on the humidity of the air and the tempera-ture. The electromotive force of each cell differs from one voil by only two or three per cent if exposed to very different conditions of temperature and humid-ity, but it has been kept steady to within 01 per cent

for two or three consecutive days.

In conjunction with an electrostatic voltmeter, the battery is very convenient for the following purposes in all experiments involving the use of a quadrant in an experiments involving the use or a quadram voltimater, as the needle can be charged to any desired voltage up to 1,000 volts, since the battery is so designed that one or any number of elements can be taken, for the comparison and calibration of electrostatic voltmeters, for the comparison of capacities, and for the measurement of high resistances by the method of discharging a condensor through them and noting the time taken

### DETECTOR FOR FIRE-ALARM BOXES.

The problem of so designing a fire alarm box that it can be opened and operated by any one in an emergency and yet will tend to prevent the sounding emergency and yet will tend to prevent the sonating of false alarms, is one that has engaged the attention of lawestors for many years A very ingenious solution of the problem is presented in the accompanying illustrations. The alarm box is closed by a cover which has to be raised as shown in one of the illustrations to permit the operator to insert his band through an opening and release the alarm mechan ism. At the moment of the release a handcuff closes over the wrist of the operator, as illustrated in anover the wrist of the operator, as insurrated in an-other photograph. The handcuff is not challed to the alarm box; for this would make a prisoner of the operator of the alarm, whose services might be badly needed at the fire Instead, however, the handcuff should be of value to small as well as large dealers. The machine consists of a megazine and a means of taking one cap at a time from the magazine and pressing it firmly into piace on the top of the milk bottle. It not only adds to cleanliness in dairies, but saves time, inasmuch as it is many times more rapid in the operation of capping bottles than the hi

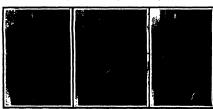

PORTARER ROTTLE-CAPPING MACKING

hands. One type is portable and is operated by a quick squeeze of the handle. The other type consists of a battery of cappers which will operate to cap a number of bottles at once The magazine take caps in packages from the machine which made them ites the necessity of handling the cap itself

### UMBRELLA SHELTER FOR AUTOMOBILES

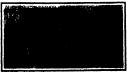

It is impossible to enter a vehicle on a very rainy day without getting wet, because the umbrella must

Compting the alters DETROTOR FOR PIRE-ALARM BOXES.

erves merely for identification. It is made of such from that it cannot be concealed under the coat glosve serves merely for identification it is made of such form that it cannot be conceased under the coat sleeve and it betrays the sounder of the alarm to the gen oral public, and is an honor to a man unless the alarm is a false one. Not until the fire chief has arrived with a special key to fit the handemy at the device be removed. This system is also applica-ble to boxes which are locked. It frequently supplies in such cases that the keys are loaned out and it is impossible to determine who sounded the alarm even whom it is known whose key is missing.

OFFIRE SILLSONIES BY RACETER. (Greater presentions nor than the handling milk than any other form of food, because it is such as accellent medium for breeding grams. Hand work is always objectionable because of possible contamination from unclean flagers. Hereforer milk bottles have commonly been capped by hand. Now a simple machina has been invented for doing this work which

A MACRINE FOR CAPPING FOUR WILE BOTTLES AT

be lowered before one can step inside Surely it is just an nocessary to provide vehicles with some sort of a shelter, such as the awning of a store or the marquee of a public building However, anything projecting from the side of a whelce would be objectionable. The difficulty is surmounted quite cleverly in the automobile, while is illustrated in the accompanying engraving. A collapsible awning is attached to the oport the sutmobile, said also to the top of the door, so that when the door is opened to admit the peanment or to allow a passenger to alight, the awning senger or to allow a passenger to alight, the swring will open and protect him from the rain while be is raising or lowering his umbrella. When the door is closed, the awning shuts up like a fan.

then the she was a miderammer alghir the she was a miderammer alghir the she was derived to resolve the she was destinated an annual to the color of the we called the home of seven hundred thousand souls to be other than a mi-croscopically beautiful toy

"When nearly above the office of the inquirer, we celebrated this occasion by flying our ballast and shooting upward, which turned us mere to the east, and we were above the Delaware, at an altitude of about a mile. Here we wrided the fact that we could see with the naked crow the bottom of the river, and with a very the bottom of the river, and with a ract that we could see with the naked eye the bottom of the river, and with a large spygiaus clearly distinguished the great stones in its bed "Indeed, one of our fellow voyagers in-

sisted upon it that he observed the mo-tions of the fish. Certain it was that the tions of the san. Certain it was that the ripple of the plying steamers was most marked, and then we turned to the ship-ping Having taken a patriotic squint at the Island of Smith, and the still more celebrated Tinicum, we reached the Jersey side at five minutes past six, observing Camdon in all its glory The conserving Camdon in all its glory. The current took us more directly toward the cast, and we for half an hour or more fol-lowed closely the Camdon and Atlantic Rallroad, which could only be distinguished from the turnpikes by the aid of guinout from the turplices by the aid of a glazz. In the moving penorama, the fertile fields of East Jersey formed a most beautiful portion with the Rancoma and Co per's Creek winding anakelike through wee oblong inmissures, distinguished only by the different colors of tinguisance only by the different colors or ripe wheat, growing corn, and other to-kens of peace and plenty Toward the ocean, a bank of cumulus clouds rose up, ocean, a bank or cumulus clouds rose up, and in the west the city was growing dim. We passed over Haddonfield and near Long-a-coming and Waterford, then began to go much higher and faster, havd right through a fleecy clo Beneath us stretched almost interminable pine forests, with the white sand sparkling here and there in they patches We were at this time at the highest alti tude attained during the trip, about three miles, and moving to the east at the rate of at least sixty miles an hour Here the earth appeared convex instead of concave, a phenomenon often observed the spirits of the party became almost as high as the barometric location of their bodies. We individually got up the lad der into the hoop and insisted on a ing songs, which, owing to the rarefaction of the air and the ocho from the balloon, had quite a stentorian effect. At this had quite a steniorian offect. At this point, as we were far above the smoty base surrounding the earth, and also the has possible that the point of the surrounding the surrounding the surrounding the surrounding the surrounding that the surrounding the

surrises and sunsets within the space of minutes The atmosphere, even at our greatest elevation, was not so cold as was scenario, was not so cold as was expected, owing to the rays of the sun being generally refracted from the hazy clouds below The chief physical mani-festation of our situation was in the cars, for when descending from a more rare for when descending from a more rare-fied to a denser atmosphere there was a whiszing, much like that in the diving, and from the same cause. "Although it had been the aeronauts'

intention to reach the ocean, which now was visible, the sails on it being seen by the telescope, yet a delay of two hours occasioned by the vastness of the prepar occasioned by the vastasse of the prepar-ations before starting, limited the time so that it was an alternative to land on a somewhat unimabilite doese without day-light to direct us to a proper spot, or take the back track. The latter course was most prodent in reference to the se-curing of the balloon, said as directing (Onacheded on page 1871.)

THE easiest riding vehicles on country roads are IHC Auto Buggies for these reasons. High wheels protect occupants

from jars when going over rocks, clock or lymps. The same resolved or obstruction of any kind naturally offers more resistance to the low than to the high wheel. In plain language, the low wheels must jump over—the high wheels roll over. That's one big advantage of high wheels. It means not only greater comfort but less far and jult to the working parts of car.

# For Business and Pleasure

## INTERNAL COMBUSTION PUMP

account of the second of the second of the contradiction of the contradi

turn flow, the column starts to move back toward the pump, and gains veloc ity in this movement until the water reaches the level of the exhaust valve, which it shuts by impact. The result is that a certain quantity of burnt products of combustion becomes imprisoned in the cushion space P and the energy of the moving column is expended in com the moving column is expended in com-pressing this gas combion to a greater pressure than that due to the static head of the water in the clevated tank & T Consequently a second outward move-ment of the column of water takes place. ment or the column of water takes place, and when the water reaches the level of sales be the pressure in the space F is once more atmospheric, and further movement of the water opens valve A. by suction against a light spring, and draws in a fresh gaseous charge If there were no friction the water would fall to the same level as that from which the last upward motion started, but the is slightly less than this movement would represent. Once again the column of water returns under the elevated tank of white returns under the elevated tank pressure and compresses the charge in the combustion chamber which is then ignited at the moment of maximum com-pression, and the same cycle of opera

ignition is timed by a small ap paratus somewhat resombling an ordin ary engine indicator, which closes the electric ignition circuit at the point of maximum compression, an ordinary small battery, trembler coll, and sparking plug as are used in automobile practice

in starting the pump for the first time, compressed air is allowed to flow into the combustion chamber until the volume of air introduced is rather larger than the usual charge. The exhaust valve is then auddenly opened by means of a handlever, and the escape of the compresses air permits a movement of the water col umn, which gives the cushion and suc-tion strokes, and so draws in a fresh com bustible charge, which, when the current is switched on and consequently fired, starts the pump working regularly When the pump is stopped in the usu regular work, it always stops with a fr combustion chamber, so that it is only necessary to switch on the current and the pump is started up. This enables the board and without any preliminarie

ne pump has been severely tested, and is now in regular daily work at a large pumping installation in the Midlands, giving complete satisfaction. The absence of all complicated gearing such as exists in the ordinary explosion motor is an out-standard. the ordinary explosion motor is an out-standing feature, and guards the engine against breakdown, the only part that could fail being possibly a defective mushroom valve or spring Wear and tear is also reduced to an insignifi-cant quantity, and the troubles incidental to labrication are expression. to lubrication are overcome

In its simplest form the apparatus con-verts gas power into hydraulic power, and may, therefore, he called a gas pump, but if the power is to be taken off a rotating if the power is to be tagen in a country shaft, the high pressure water is passed through a water turbine, and so back to the apparatus to be continually circulated. The invention can also be applied with equal facility and efficiency for the com on of air

The pump has been elaborately de-scribed by the inventor in a paper published in the SCIENTIFIC AMERICAN BUT

The successive sections are coupled together by means of links 40 inches in length, and the coupling pins are placed at the center, from which the curves of the abutting ends of the plat-form sections are structure. corresponding to spinting east or the pus-form sections are struck, consequently, the opening between the joints may be reduced to a minimum, and a smooth surface presented for walking, with no open spaces to bewilder or trip the pas-

The passenger-carrying capacity be moving platform is just double maximum capacity of the present Sub-way trains. According to the figures of way trains. According to the sigures of the Public Service Commission, the total rush-hour capacity of the firecar local trains per hour is 23,500 and of the eight-car express trains 25,000, whereas the moving platform, according to their estimate, would carry 73,500 passengers per hour They state furthermore that for all distances less than four miles the for all distances less than four miles the moving platform is a quicker and more convenient mode of conveyance than the present local train service and even quicker than the local and express servquicker tann the local and express service combined, since a passenger may reach Times Square Station, from any local station south of Fouriesanth Street (that is, supposing a moving platform were installed on a north and south average and the state of nue) quicker by the moving platform than by the local and express trains of the present Subway

In conclusion, however, we would

sound a note of warning with regard to the possible interference of any moving the possible interpretance of any moving platform subway that may be built with any future extensions of the present Subway In selecting the routs, care should be taken to choose a location where the moving platform subway will not block any of the future through lines which must ultimately be built on practically every avenue in New York

Why Are We Right-Handed; (Concluded from page 261) the lesion on the right side. The hand and arm centers in the brain are inti-mately linked in the cortex with the speech centers. And certainly Crichton Browne is correct in the inference that the preferential use of the right hand and arms in voluntary movements to the leading part taken by the left brain "We could not get rid of our right-handedness, try how we might, it is weven in the brain." And this, I believe, is the conclusion to which we must scientifically arrive "In the curious disscientifically arrive "In the curious dis-ease aphasia, in which one forgets words, the lesion lies in Broca's convolution, one cannot say cup, for example, though one sees a cup, but when the right hand touches the cup, the patient at once ut-

volution, did the heart tend to be on the left side, and the left brain tend to greater development, because the right hand came to be the most used? Or did the right hand come to be most used, the right hand come to be most used, because of these heart and left brain phe-nomena? I am, for my part, of the for-mer opinion; the heart on the left side, and the greater left-brain development, are effect rather than cause, coming gradually to pass as man, in the strug-gia for the survival of the fittest, found right-handedness more and more advan-

trades in which a certain amount of am-bidexterity is essential. For example, trades in which a certain amount of am-bidexterity is essential. For example, the pianist, in playing the fugues of Bach, must produce with the left hand-almost the same tones as does the right, almost the same tonce as does the right, and has to work a little harder too, for the bean notes of the pisace are more thickly wired than the revels. A certain amount of ambidectority is essential in the surgeon. Tet this gift has its disadvantages, withink as when a colleague childed in this way admitted to me that, before doing a thing he weithed appear. time in wondering which hand he d employ. But it is rarely really tial that such ambidestarity be so

Finally, it may be objected, in favor neral education in ambidexterity se one loses his arm, and that such suppose one loses his arm, and that such as unfortunate be a clerk, who must earn his living by writing Such con-tingencies are almost as rare as the famous one by which Mrs. Brown justi fied to her husband her junk-shop pur-chase of a brass sign stamped "John Jones, Undertaker" "Our daughter will acon be of marriagable age, she mor marry an undertaker whose name mor be Jones, possibly John Jones, think how handy the sign will then be" In those rare cases of right handed mutils ion there will in time follow, through education and practice, an adequate de-velopment of the right brain, just as if the unfortunate had been left-handed

## TREATMENT OF STEEL IN

(Concluded from page 262) remains that by doing so Riemer has been able to demonstrate his success in pipe elimination on a considerable and commercial scale. A large number of steel shafts, the steel for which was made by this process and with which the dis card was kept at 10 per cent or less, have successfully passed the British Board of Trade requirements. Indeed, a reference successfully passed the British Board of Trade requirements. Indeed, a reference to Fig 1 shows an ingot, treated by this method, in six transverse slabs on the right and left. The slab shown on the r left hand came from near the top ne ingot The longitudinal slab to of the ingot of the ingot The longitudinal slab to the right of the center of the figure is from another ingot treated by the same hottop procedure. The inconsiderable depth of the pipe seems pretty ovident It extends perhaps 10 per cent of the total length But the actual percentage of steel involved is evidently much less

than 10 per cent of the total

We have in Figs. 2 and 4 two views of the gas furnace There is an eye at the top which facilitates movement of the apparatus. Through two pipes—seen to advantage in Fig 4—the gas and air enter The air is under pressure In cases where it seems desirable to do so the furnace may be employed as a means of heating the top of the mold prepara tory to teeming the steel into it. The then be let down until its lower edge is well inside the mouth of the mold, when the pouring of the steel may be performed without removal of the furnare There is thus ample op-portunity to begin action without delay However, it is regarded as important to have not only prompt application, but an intense heat at once This requirement is met by preheating both gas and air In fact, heat may be applied in such in tensity as to raise the temperature of the sion It has been found unnecessary to prolong the treatment until solidification npleted. This is a favorable item as thus the apparatus is released for as thus the apparatus is released for other service, to which its portable observed has been as the applicable In Fig 4 the furance is in operation heating the head of a 50-ton ingot. It will be understood that in this view the built of the mold is invisible The naked fames play upon the metal at the top of the ingot The prehesting of the top of the mold tends not only to conserve the heat of the molnot only to conserve the neat of the mol-ton steels, but also to prevent heat loss by conduction from the gas flames. The furnace is being used in Fig. 2 for the purpose of preheating However, the in-got is, in this case, said to be present. Now in all procedure for the elimina-

Now in all procedure for the elimina-tion of the pipe, we must not reach final conclusions as to their success without inquiring as to the segregation. The seg-regation is a locality where the steel has an excess of carbon, suiplur, phosphorus, etc., beyond the average contained in the inget as a whole. Ordinarily, it should be removed to the process of the properties of the properties of the process of the properties that got all the properties the inget at little below that point. However, it is wall to inves-

tigate this question with some thorough ness, as the mothod of treatment itself may, conceivably, introduce variations from the rule Steel of uniform compo-sition is wanted. An ingot cust by the hot-top process was investigated as to its holdop process was investigated as to its composition. The average carbon content should have been 0.25 per cent. By taking samples along the axis all but one were found to contain carbon in percentages running from 0.23 per cent to 0.25 per cent. The viewplon was those under the tail of the pipe. Its carbon percentage was 041 per cent. Similar results were found for sulphur and phos phorus. Thus they existed in the segre-gate in percentages about three and one-half or four times what they did below it.

EGGS OF CURIOUS PORMS.

(Continued from page 43) side the extinct Madagascar bird, the Epyornis, which measured more than thirty inches in its smallest circumfer-

The smallest birds' eggs are those the minute species of humming birds, which are smaller than the eggs of cerwhich are smaller than the eggs of cer-tain kinds of tropical beetles. But file common cuckoo lays the relatively small-est egg. That is to say while the jack-daw and the cuckoo are about equal in size, the formers e.gg is five or six times larger than the latters. The fact that the cuckoo is wont to deposit its eggs in the nests of birds which are unauly much smaller than itself doubtless accounts for this The relatively largest counts for this The relatively largest egg is laid by the kiwl, a strange wing-less New Zealand bird The egg is no less than five inches long, although the ex-treme length of the bird itself is only

twenty-seven inches.
Reptiles eggs are not very attractive objects. In the case of crocodiles and many kinds of tortoises they are palecolored or white, and resemble those of birds in shape. But the egg of the gopher tortoise is remarkable for its comgopuer tortoise is remarkable for the com-plete roundness. It might well be mis-taken for a golf bail' Many anakes eggs are soft skinned, brown as to color, and look for all the world like a number of new potatoes.

new potatoes.

The rggs of fishes are usually small, soft, and inconspicuous. The most remarkable point about them is the extraordinary number laid by the individual A single cod for example lays as many as nine militon eggs. But a strik ing exception to this piscine rule of numerous inconspicuous eggs is seen among the sharks and their allies These "tigers of the sea" lay eggs which are large in size, few as to numbers, and deposited singly instead of in masses. These eggs, of which several examples are shown in the accompanying photos, are known to flaherfolk by such names as 'pixy purses' "fairy purses,' or "mermald's purses," They consist of a dark-colored, loathery envelope, and are usually adorned with frills, horns, or long twisted tendrils. These appendages serve the purpose of keeping the egg case sup-ported among the branches of seawerds, thus preserving the cubryo from the damage it would sustain were the damage it would sustain were would sustain were worker by

Amphibians-frogs newts, and the like —lay fish-like eggs without exception The Surinam toad, however, has a remarkable way of dealing with the eggs when they are laid. The male takes the eggs one by one, and imbeds them in the eggs one by one, and imbees them in the actt skin of the female s back, each egg in a separate cell liere the eggs re-main being carried about by the female until the young toads hatch. There may until the young toads hatch. There may cells in the back of a single individual although from sixty to seventy is the ore common number

The egg laying habits of the "midwife" frog of Europe are almost equally curi ous. The eggs are deposited by the fe-male in the form of long chains which may be upward of a yard and a haif in length These chains are taken by the male and wound around his legs and (Concluded on page 270)

Classified Advertisements thighs. Thus requipped, he retires to a Assentiates in this souther him is been sensed. Committee to the bank of the stream, where he has not her seed to the life him to the stream, where he made is not the seed to the s poles are on the point of hatching. Then poles are on the point or naccing. Than he enters the water, when his off-spring emorge from the eggs, and wriggle away to take care of themselves. On the seashore, after rough weather

may often be seen an object which bears no small resemblance to a cluster of purple grapes. This is a mass of cuttle fish eggs—that strange, eight-armed mol-lusk which disports itself in the waves to the undoing of such marine creatures as are unlucky enough to come within grasp of its suckers. Each "sea grape" is produced with a flexible stalk, by means of which it is joined to its fellows, the whole mass being fixed to some stationary object, such as a rock or stone But like the eggs of so many marine creatures, the eggs of the cutt at the mercy of the elements, and in times of tempest they are often torn from their moorings, and cast bruised or broken upon the shore.

Near relatives of the outtle are snails and shellfish of many kinds, and among this great group of animals' eggs so many strange forms are found that a many strange forms are found that a description of them would fill a bulky volume Many of the large land smalls produce hard-shelled eggs; differing little in appearance from those of birds. An example is the West Indian Bulissus, shown in the annexed photograph, to-gether with its white, clongated egg But the egg cluster of the common whelk (Bucrinum) is like a rather dingy honeycomb, partially squeezed between hands. When the eggs are alive hands. When the eggs are allve and healthy, the form of the young whelks can pisinly be seen through the semi-transparent unstance which envelops them. Another quaint form of molluscan egg is that produced by the turnet shellfish (Twrretrile) The eggs are joined together like a number of small beeds on a fexible cord

If the eggs of mollusks are varied in If the eggs of mollusks are varied in appearance, the eggs of insects are infinitely more so. Moreover, many of them are marvelously beautiful in form and embellishment. This beauty is almost always hidden from the eye unatided by the microscope, for the eggs of most insects are more specks, often aided by the introceope, for the general color most insects are more specia, often less bulker than our first of and the second of most insects are mere specks, often ar oggs and by the minute ansects which spend their whole lives among the feath-ers of birds. These minute beings pass under the unsavory title of "lice" Yet under the unaxory title or "lice" is their eggs, when magnified, exhibit as amusing diversity of form and a beauty quite fairy like They are among the most popular of microscepic objects.

In conclusion it may be said that cer tain insects deposit their eggs in clus ters which bear no little rese muts or fruit Such is the case with the "rear-horses" (Mentide) and their allies. Possibly this resemblance may be of importance in protecting these eggs from the attacks of insectiverous birds and

at Mannesburg. In addition to the four, peven periodic comets are expect to return in 1910. Probably not all of comets will be visible, b will be unfavorably situated with re to the sun at the time of perihelion pas-sage. The expected comets are the fol-lowing '1 Giacobini's comet, 1896 V I sowing I discount's comet, 1899 v it was first thought that this comet would reach its perihelion about the middle of February, but later calculations have proved that it really passed its periheproven that it really passed its perilie-lion last December It has not yet been seen and, as its position is very unfavor-able, it may escape observation alto-gethor. 2 Swift's comet, 1895 II This comet was not seen at its return in 1902 and unless its orbit has been consider ably changed, the conditions for its observation will be still less favorable this year it should have passed its perihe-lion about the end of January, and should then have been almost exactly behind the sun 3 The second periodic comet of Tempel should reach its perihe-lion about February 21st unless its orbit has been greatly changed since 1904 has been greatly changed since 1894, when the concet was last seen. The conditions for observing this conset in its periled properties of the control of the to unfavorable conditions 'rms year,
if its orbit is not changed, it will reach
its perihelion in October Its position
then will be very favorable for observa tion, so that this comet will probably be visible next summer 5 Spitalers comet 1890 VII escaped detection at its visits in 1897 and 1903, because of poor condi-tions for observation Dr Hopfer, of Trieste, has shown that the orbit of this comet has been greatly altered by per-turbations caused by the influence of Jupiter between 1890 and 1903. In consequence of these perturbations, the perifrom 6 42 years to 6 82 years. The comet should pass its perihelion in October, 1910, in conditions favorable to its redis-covery 6 Fayo's comet is also expected return in the latter part of October conditions favorable for observation In conditions rayorable for observation.

7 Brooks's comet, 1889 V, is expected to reach its perihelion in the summer of 1911 but it will probably be discovered during the coming summer.

Moving Picture Royaltics, The moving-picture industry is on a distinctly theatrical basis. It has its "trust," its theaters where actors play before a camera, its scene shifters, its supernumeraries, its property men, and a whole theatrical staff more or less simi lar to that of the regular theater. The "trust" in question was formed about a year ago by a number of manufacturers of films under the title of the Motion Pictures. Patents. Company. Patents, chiefly those of Thomas A. Edison, were pooled, and active steps were taken to purge the moving picture theater of some of the more objectionable pictures which have brought down a hail of criticism upon the industry, to license the movingpicture theater to use the apparatus and exhibit pictures, and to control the in-dustry in general There were many inexhibit pictures, and to control the in-dustry in general. There were many in-dependent manufacturers who refused to pay royalties or to acknowledge the patent rights of the Motion Pictures Patpacear rigue or the section recurser rate can be company. A suit was recently brought by the company against Carl Learnine, a well-known manufacturer, and the Independent Moving Picture Company of America, of which he is president, as well as the Pantograph Company to the company of the com president, as well as the Pantograph Com-pany, to restrain the alleged further in-fringement of Edison patents controlled by the Motion Pictures Patents Company. Inaumuch as the patents in question had already been adjudicated and their va lidity upheld, an injunction was granted The hearing brought out some ver-steresting statistics, which will undoubt

edly open the eyes of the gener (Concluded on page 272.)

## SPARK COILS

Their Construction Simply Explained Scientific American Supplement describes the making of a 116-feek grank

1887 describes a season spars non non content of the content of th

(Concluded from page 210) ns that every day some four

or five million persons attend the thir-teen thousand moving picture shows of the United States. The pictures which flicker on the screen before the spectators are projected by means of appara-tus, the basic patents of which were taken out by Thomas A Edison These four or five million persons, therefore unwittingly pay royalty to Mr Edison whenever they hand in their nickels of their dimes at the box office. It is stated that about 1,440,000 feet of film are mad that about 1,440,000 feet of film are made by the members of the Motion Pictures Patents Company On this production a royalty of half a cent per foot is paid to Mr Edison, so that his revenue from the moving picture-loving public amounts

The action was brought by the vic-tion Pictures Patents Company to re-strain infringement, but the defense set strain infringement, but the detense set up was that the company violated the Sherman antitrust law The decision handed down by Judge Noyes of the United States Circuit Court was that the question at issue was patent infringe ment and not violation of the anti-trust law, for which reason he granted the injunction

The Brennan Mono-rall ( ar. successful demonstration was given recently at New Brompton, of the Bren nan mono-rail car At the trial an Mi-horse power generating set was working The trials commenced with running the vehicle loaded with packing-cases, round the circular track of 105 feet radius at a speed approaching 20 miles an hour The stability of the car under these condi-tions was apparently all that could be tions was apparently all that could be wished, the schiele canting over several degrees toward the center of the circle of track. This demonstration was followed by an exhibition of the facilities afforded by such a car for unloading. The vehicle was intentionally titled over our to chocks on the right-band side and some seven unloaded. It was then Kerosene Oil Engines

Radio, Settlemy, Perkible

On David Register of the Control complete circuits of the one-eighth of a mile track were made with each load During these runs we timed several During these runs we three new several rounds at speeds of between 18 and 20 miles an hour The motion on board was quite pleasant the vehicle riding very well The inward cant that the vehicle acquires when traveling on curves at

high speed naturally added to rather than detracted from the comfort of the

passengers Altogether some 300 persons had an opportunity of being on the car riages under these novel conditions The riages under tuese novel conditions rise demonstration which followed showed the ability of the vehicle to take sharp curves, this, however, revealing nothing more than was evident from the earlier trial toward the close of last year. The

carriage, with passengers on board, was high a speed as was practicable along the straight with perfect success. The slight lateral awaying under these condi-

# A Boon to the Busy Man

The use of the most modern type of speed-making locomotives, coupled up to the best type of equipment and guided by the most vigilant management makes railroad travel secure and prompt

The time of a busy man is one of his assets It means either gain or loss to him.

The certainty of figuring his time in transit to the exact hour relieves his engagement hat from entanglement. The telephone may make the en-

gagement, the train will keep it. The Pennsylvania Special fol-

lows up the telephone message. It brings the two ends of the wire together and consummates the meeting between working hours

The man with business connections in New York and Chicago can lose no time by traveling on the Pennsylvania Special. It runs while the desks are closed.

Pennsylvania Special (18 hours between New York and Chicago) leaves New York 355 p. m. Downtown Tube 405 p m. and arrives Chicago 855 a m

Over five hours for business to 245 p m when it leaves Chicago for the East and arnves in New York next morning (Breakfast on the train) at 9 45 a m

# You Know the Horse-Power Of Your Engine— Do You Know the Steam-Power of Your Coal?

"—And Steam Power is but another term for 'Dollar Power.'" This doesn't mean the quantity of coal you get for your money-for there's many a culm bank to be had for the hauling. It means that the money value of coal is determined by the amount of steam that coal will produce.

The heat-producing steam-making efficiency of coal is a question that should be settled before the coal goes under the boiler. It is a

problem the Pennsylvania Coal and Coke Company settles for every user of Pardee Coal.

Not by guesswork, not by the eye or hand is it settled, but by accurate scientific determinations of experts who are constantly at the service of consumers. In

Bristol's Recording Thermometers

# F BITUMINOUS 💽

you are assured the fullest measure of efficiency from every ton because Pardee Coal is all mined from the same basin and runs practically uniform. This uniformity means dollars to the man who pays the bills. Knowing your coal con-

sumption, you can order Pardee

Coal by the calendar.

Pardee Coal is low in sulphur and ash. It is economical.

The services of our mechanical engineer or chemist are at your disposal without charge.

NEW YORK, SATERDAY APRIL 2nd, 1910

The Fixer is always girl to Province for examination illustrated actuals at the second of time ty interest. If the photographs are object, the articles and the facing and leading the contributions will province appeals attending. According to the contribution of the THE PARAMA CANAL AS AN INVESTMENT

ONSIDERABLE doubt is being expr Just now as to whether the Panama Canal will prove to be commercially a paying investment and in a series of articles, which have recently been published Admiral Evans, proceeding slong several rather formidable lines of argument, is apt to leave, at the first reading, a de-pressing conviction that this great national undertak

ig can never be self supporting.
On the other hand, there is the fact that other go cm care orner nana, there is the fact that other great canals, such as that at Sucz and the one which has made Manchester a seaport, were, during their construction, the subject of similar dismal foreland ings Yet Suez has proved to be one of the most profitable commercial undertakings in the history of the world and the Manchester enterprise, in spite of the few lean years of its carlier op ration is now ac-

complishing all and more than was promised

It is well to remember, moreover that the admirals presentable with a full reference between creatin trade-cuties; in the two sends and he assumes that unde-cuties; in the two sends and he assumes that under-the distances righ Pannan are aborter than those over the present routes, the new saterway will be power-less to divert existing trade from ills present lines of sailing. Now although the principle as here laid down is breadly overed; it should not be forgottu pessimistic view of the future is based much a comthat the connecting of the two great oceans is certain to materially affect the trade conditions along the stretch of both the Atlantic and Pacific scap of North and South America. Indeed, the cutting of the canal may so calarge the trade and importance of certain of the maritime cities as to render it expedient for shipping which at present uses the Suex Canal route to take the longer route by way of the Panama Canal

But we should judge of the value of the Panama Const rather from the military than the commercial point of view—a fact which is well understood at dington where undoubtedly it acted as t pelling motive in urging Congress to undertake this stup alons work. That 14 000 mile trip of the battle-ship Oregon during the Spanish was was an object beson, the significance of which has maker been for-gotten. The opening of the canal will render the whole naval force of the United States available in of ther ocean In its ability to strike a rapid and declaive blow at any threatened is int along the whole of the Unite! States seaboard the efficiency of our fleet will be practically doubled, and the fact that the whole may can in a few weeks time be assembled in the Pacific Ocean will enormously increase the mayal prestign of the United States in the Orient and must inevitably tend to preserve the peace in those great Oriental questions which begin to loom so large great Oriental questions which begin to toom so targe on the diplomatic horizon. So long as the lathmus of Panuma, exists as a barrier between the Atlantic and the Pacific we must build at least three battlevilus where others so we would build two, and the first cost of construction and the heavy cost of maintenance and operation will far exceed any temporary or even permanent deficit which may develop in the operation the caust as a commercial venture

Meanwhile under the administration of that most efficient holls, the Corps of Engineers of the United States Army the accution of the work is proceeding Blates Army the averation of the work is proceeding with a rapidity which is in pleasing contrast to the confusion and disempointment which marked the carrier warm of American occupancy and in the series of striking illustrations of the work which we present in the present lesion, we are enabled by our readers an adequate impression of the magnitude and solidity of the permanents works, the most mon-

### RELATIVE REPAIRS ON MANY-BUILT AND CONTRACT-BUILT SHIPS.

HE wisdom of the policy of building at least a small portion of the new ships of the navy at our leading navy yards has been and is yet a question upon which there is much Jet a question upon which tore is much division of opinion. The principal argument in favor of this policy is that it becomes possible to maintain an adequate force of skilled mechanics permanently at the yards, and avoids that disastrous breaking up of the organization and scattering of forces which oc-curs in the slack season when the annual repairs upon the ships are completed and they have sailed for the summer maneuvers. The maintenance of a permanent force increases efficiency and insures that pernament force increases emerency and maures man the leading yards will be in a position to meet at once the heavy strain which would be thrown upon them in the event of sudden hostilities. Of equal impor-ance to the question of the effect of new construction in maintaining a permanent force in the navy yards is in maintaining a permanent force in the navy yards is that of the character of the work that they can turn out Conclusive data upon this subject are furnished by those two sister ships the 'Connecticut' and the Louisians the first built at the New York pary yard, and the latter by the Newport News Shipbuild ing Company If certain disabilities under which the navybuilt ship labored, due to slowness in the delivery of armor and the fact that she required special fittings as a flagship be considered, the time and cost of construction may be regarded as approximately the same as those of the ship built by contract.

As to the question of the relative quality of the work done, there is no surer test of this than the amount of repairs which have been made upon each vessel in the four years that they have been in commission. The following figures, taken from the report of the Paymaster-General of the Navy are very conclusive on this point. In 1906, their first year of service, the repairs on the "Connecticut cost \$236 97, and on the Louisiana \$5,-09 In 1907 the repairs on the 'Connecticut' ounted to \$53,557 47, and on the 'Louisiana' to \$99, 851 09 851 09, and the totals up to the end of the fiscal year 1909 were, for the navy built ship \$111,833 58 and for the contract built vessel, \$149 167

In view of the fact that during these four years the cost of the repairs for the Connecticut' was about it per cent less than that of the Louisiana" what beof the oftrepeated statement that our )ards are incapable of turning out work of the same high quality as that of our private yards?

## THE REED OF AN IMPROVED PARCELS POST

HM existing restricted parcels post system of the United States Post Office, as established by Congress in 1874 has so far limited the disc between manufacturers and consumers that it is making the United States appear to be wonderfully behind the times as compared with some foreign us Germany It is a fact to-day that an American in England can send home by mall to any part of the i nited States a parcel weighing two and one half times more than the United States limit for about one-third less in cost than the present bone rates more time the three states limit for about one-three less in cost than the present bone rates in other words the world possal union package unit is elevan pounds to the parcel at the rate of twelve cents her pound. Whereas the little distates unit is only four pounds to the package at a cost of sixteen cents to the pound. The parcel rate in the United States prior to and early in 1874 was eight cents per pound for a package limited to a weight of four pounds. After that the rate was doubled, but the weight remained the same. Since 1874 the cost of transportation has greatly decreased. The question is, transportation has greatly decreased. The question is, why should not the public through its representatives in Congress be given the benefit of this decrease by the establishment of a uniform low postal rate for parrels that will encourage the use of the Post Office. as a medium of exchange of commodities, and thus

Since the experimental introduction of the Rural Free Delivery system in this country, its operation has proved so great a necessity, convenience and success that Congress overlooks the annual deficit arising from the unreasonable restriction placed in the law limit ing the kind of postal matter to be carried to letters, newspapers, and periodicals. The weight of this aver-age load is ascertained to be but twenty-five pounds while the vehicle which the postal agent is required to supply can readily carry two hundred pounds it is estimated that should the restriction be removed and parcels be carried, even allowing only one or two parcels per trip, enough revenue would be re-ceived from the additional postage to more than pay the total cost of this system, and make it sell aupporting

A movement in this direction is the intro A movement in this direction is the introduction of a bill before Congress, prepared by the Postal Progress League known as the Bennett Rural Parcel Post Bill. now in the House Postal Committee, which provides

for very moderate postal local rates along a between the city or town and places in the country It would enable the merchants mercial center to send, may on telephone of es directly to the purchaser living on and would promote the exchange of merch tween the residents themselves on the rout as their sending products to the commercial the service would be somewhat similar to that of 6 usual postal railway coach and its collection and dis tribution of mail matter
With the extension of good roads and the use of

with the extension of good rosas and the use or rapid automobiles, a longer route could be established than now exists, as a maximum distance, which would reduce the number of vehicles required and econo-nise the cost of maintenance

In this connection the experience of the use of the mail automobiles in London is worthy of note. At the second annual dinner of the Royal Automobile and the sociated Clubs of London in the summer of 1909, Henry Norman in a speech alluded to the success all automobile as a time and money saver is the mail automobile as a time and money saver is the transportation of mails, by saying that in the sity there were thirteen local motor services averaging thirty two miles a day. There were also ten sets at services in and out three times a day between Landon e principal towns on the outskirts of the city. In the thirteen long-distance night automobile mail coach services a saving of \$300,000 a year was ef-fected as compared with the horse service which did the same work only a few months before. The Len-ton Post Office is now operating no less than sixty f these motor services. Results of this casracter certainly show that the of the

establishment of a very low posts; rate for parcels is feasible since it will treate more than sufficient revenue to pay the cost, besides saving money for the mer-

ant and consumer
It is to be hoped that Congress will give such intelligent consideration to all matters relating to postal improvement that the system, so useful and necessary to the people, will forthwith be placed upon a sound busi-

### HYDRAULIC TURBINE REDUCTION GRAD

T N the leave of the SUPPTIFE ADMILAY of February 12th of the present year, we described the turbine reduction gear designed by McFarland and McAlpine in which a mechanical gearing is in terposed on the shafting between the turbine and the represent on the anathing between the turnine and the propoller, for the purpose of reducing the secondical high speed of the former to the relatively low so-nomical speed of the latter, and it was noted that a nechanical officiency of UKS per cent had been secured in the shop tests. Simultaneously with the development of this gear, the problem was attacked by Dr. H. Fottinger who, with the assistance of the Vulcan Works at Settin, has produced a reduction gear which substitutes for the toothed gear of the McFarland system a set of hydraulic turbines through which a b of water is kept in constant circulation, and by th proper proportioning of whose buckets and channel ways the desired reduction of speed is secured. A complete description of this good with libratrations is on in the current issue of the Supresurar to which given in the current issue of the Stoyrs surver to which reference is made for fuller details than are here given. The turbine shart and propeller shaft are in-puted to the state of the state of the state of the pump, which delivers its water into the backets of a vater wheel which is mounted rigidly upon the pri-poller shaft, and it will be soldent that by selecting the proper relative dimensions of the two members, and the desired ratio of speed between turbins and pro-peller can be obtained in its simplest form the re-ceived and the state of the addition where when the state of the state o a driven water wheel, but in the larger powers one or more intermediate wheels would be interposed be-tween the pump and the driven wheel, indeed transformers with one or more stages are preferable when a considerable reduction of speed is desired. With a reduction ratio of between 1 to 4 and 1 to 6 uring two reduction stages, an efficiency of from 80 to 83 per cent is secured. This seems low when compared with the 885 per cent efficiency of the McParland gar, but the Cerman system has the advantage to it is readily reversible. The system has been tried on a small vessel of 175 teas, which has been driven by a 500-horse-power turbins at a speed of between 13 and 13 knots. When the reversing lever was thrown over at full speed, the propoller shaft came to a standish of the standard a reversed speed of between 300 and 150 revelletions. Similar to the shade, if would seem that the German, because on the standard of the shade, if would seem that the German, because can system on ships that make long continuous versars. On channel and river steamers and for tugs and small vessels it has some advantages. with the 985 per cent efficiency of the McF

defects which were developed curing the flood. The work of providing adequate coast fortifications has been carried to the point at which they may now be considered to be very complete, at least as followed the complete of the control of the complete of the

### ELECTRICITY

As the Glidden four this year will pass through territory where the telephone and telegraph service is very poor, it has been decided to equip the care with wireless telegraph apparatus. This will make it possible to keep in close touch with the contestants, and the latter will be able to report accidents and call for heln when pacessary

In plants which use a gas engine to drive their generators the variations in good of the engines are not noticeable if carbon filament lamps are used, because the filament is quite thick and does not respond quickly enough to above any fluctuations in light With tungen filaments the light waverings are very annoying, and gas-engine manufacturers have from it in recomany to equit heir engines with heavier

A convenient method of determining variations in the candicepower of a lamy was described in a recent number of Elektrotechnische Zeitschritt. A selentum cell is employed, which is exposed to the lamp under test and to placed in series with a recording milliammeter. The curve recorded by the milliammeter, which is due to the variable resistances of the selen tim cell, indicates the variation of the cardicepower of the lamp. To be sure, this does not give an accurate photometric measurement.

Take photometric measurement.

A large servicion of land has been bought by the Commonwealth Edison Company in the northwester part of Chicago, where two large sometring stations are to be built. Back hatton will be equipped with of each turbine will be \$0.000 hore-power. It is a carbine and in the first station the capacity of each turbine will be \$0.000 hore-power. It is a carbon to be a superstance of the company of the company has doubted error three years for the last twolve years.

Chicago is trying a new car designed to remove city garbage over the street rallways at night. The car is of steel construction, 'th' feel long divided into three sections which are so shaped that they can be dumped with a jobe by a single man thus foing away with the necessity of using air cylinders or other mechanical dumping appearatur. The sections are very garbage. The car is not provided with motors It is intended to use the car in the daytime for haul ing concrete and construction materials

A novel method of recovering a sunken cargo has been adopted by the United States Revel Company A large maguet, 3½ foct in diameter and weighting 3000 pounds, has been employed in raising kegs of nalls from a berge that was sunk in the Mississipple River man New Orleans. The magnet raised five or alix keps at a time, or about a ton at each 101. The advantage of this method was such as that it avoided the king open the kegs as would have been the case had a dredge been need. The magnet is soon to be used for maining a sunken load of ween wire, and also for a load of state halling at the load of ween wire, and also for a load of state balling strips.

Several years ago the Illinois traction system decided to use sleeping cars between Springfield and East 81 Louis As this system has proved a success reveral more cars have been ordered for use between St. Louis and Puoria. Those cars will differ from the first ones in having no motor equipment. They will be trailers and it is expected that a good deal of the amonying vibration of the lists dear will have been come. The cars will be if feet long and will be provided to the state of the state of

The following subjects will be taken up at the International Congress of Telephone and Telegraph Engineers, which is to meet at Paris this year (1) that are the second of the second of

### SCIENCE.

Mr. E. E. Clayton, late of the Biue Hill Observatory, has gone to fluence Ayres to organize kite and balloon observations under the direction of the Argontino Meteorological Service

Mant Angström, professor of physics at the University of Upsala, died Marrh 4th. He was distinguished as an investigator of solar radiation, and 'evised the instrument adopted by international agreement as the standard for measuring this element, viz., the Augström electric compensation pyrheliometer.

The International Meteorological Committee, which assembles triennially, will hold its next sessions in Berlin during the last week of September 1510 Dr W N Shaw, director of the British Meteorological Office, is president of the committee and Prof Dr G Hollmann, director of the Royal Prussian Meteorological Institute hererotary

The Others Aside Locker

A little leaden tablet tarnished ugly and otherwise
trivial in appearance was sent a few years ago from
Athena to the imperial Museum of Berlin On one
side of it is some writing which only recently was
deciphered with precise correctness by Adolph Wilhelm
an Austrian content with lives in Athena. The tablet deciphered with precise correctness by Adolph Wilhelm an Austrian scorest who lives in Athens. The tablet is the original of a private letter that was written about the time of the orator Demosthenes The writer of the letter lived in a rural neighborhood

The form of the address was 10 or memory polary matter and to be handed to Namida, er & Thrapkies or to the son (perhaps the son et effect where we have the son to other thair predoce and and the son to other thair predoce and wares for rais may be imaginate as in progress. These the boy who was bearer of the latter was to find the sender or both of one of the three presents when the predoce and the sender when the sender was beared on the sender when the sender was the sender when the sender was the sender when the sender was the sender was the sender when the sender was the sender was the sender when the sender was the sender when the sender was the sender was the sender when the sender was the sender was the sender when the sender was the sender when the sender was the sender was the sender when the sender was the sender when the sender was the sender was the sender was the sender when the sender was the To be taken to d the boy who was bearer of the letter was to find the stand or booth of one of the three persons to whom it was addressed and deliver it to him. The text of the liter mays Muestergoes greets you cordisily his-greets your family with the same esteem and wishes

with the same esteem and wishes, them good health, and be mys abso-that his own health is good... Please be no kind as to send was a, mantle either of sheepskin or of goatskin and let it be as cheep to possible for it does not need to he possible for it does not need to he rimmed with fur Send with it a pair of heavy soles also As seen as I have an opportunity I will

pay you. So much for the letter to the motive of which the reader can point with as much precision as the author Apparently it was the author Apparently it was written in winter poor Mnesterges having been surprised out in the open country by one of these key snowstorms which sometimes even at this day cover the temples of at one may cover the temples of the Acropolis with a mantle of mow Therefore he desired to re-ceive as quirxly as possible the heavy and warm garment of the

heavy and warm garment of the poorer countryme a greater which could be longht for four and a half drachman and the strong soles which were worn under these and the strong soles which were worn under the editary sandais on the rural plains and hillsides A good pair of the latter could be longht for feer drachman as a well preserved bill of that date shows. A notworthy feature of this arthus letter formula with which it begins the very formula that may be found used in very numerous festions that one preserved by the Greek literature of later times. Even at the present day every letter virtue to we at the present day every letter virtue to we at the present of the country o preserved by the Greek literature of letter times. News at the present day every letter written by a rural Greek begins with the same cordial inquiry about the health of the person to whom the letter is written and with brief information about the health of the

Although it is possible to resolve into gas almost any kind of solid fuel in a gas producer it is well known that certain fuels—particularly those high in ash and of a caking character—give a good deal of rouble. One of the most serious of these troubles states a contemporary is that the fuel welds thatf into a large mass which partially chokes the first in the content of the content of the content of the content of the first in the content of the first in a local content of the content of the first in measure and the nonreson obtained of the first in measure and the nonreson obtained of the first in measure and the nonreson obtained. sary and the poorer the fuel the more the poining in order to reduce this poking to a minimum some In order to reduce this poking to a minimum some prodocer makers it shaking or revolving greats. The latest design of this character is due to lift Character and it is a considerable extension of the principle. The lower portion of the produces of the principle. The lower portion of the produces of divided into two or three rings which are free of such other and rotate at different speech to justice between them being make by water seals. The object is to shake the true (ontinuously so that caking or obgiging out about new results) impossible.

Bvery winter the demand for fresh eggs becomes more instatent and more difficult to supply Poultry breeders in different parts of the world have en

deavored to supply the deficiency by artificial selection. By this process an Australian breed of fowls which averages 270 eggs per hen per year has already been produced. A series of very interesting experiments on the same subject has been carried on during ments on the same sunject has been carries on suring the past ten years at Macdonald College, in Montreal, which is reputed to be the most perfectly equipped school of agriculture in America. Starting with breeds noted for their endurance of cold, especially

A PASSESCER SLEIGE DRAWS BY A TRACELESS ELECTRIC TROLLEY

Plymonth Rocks and White Wyandottes the experi rymonom noces and wante washnottes the experi-menters began the process of selection by allowing the fowls to leave the poultry yard and a ratch in the anow in the coldest weather. The prograpy of the fowls which availed themselves of this privilege was subjected to similar treatment which was continued for several generations. The poultry houses were not heated, even when the temperature fell to ze Fahrenheit, although the fowls were slightly protect from the cold by screens placed around their perchas The poultry yards were covered with a layer of straw

a foot thick, upon which wheat or millet, the only food a foot thick, upon which wheat or millet, the only food given, was strewn at regular hours. The hens were kept busy from morning until night in hunting for their food in the strew. This active exercise pre-vented the accumulation of fat and stimulated the production of eggs, for every poultry farmer knows that fat hens are poor layers. Hence, as hens, like all other birds, naturally store up fat at the approach of winter, the problem became limited to preventing this ac-

cumulation of fat, and at the same time as swring to the hens an abundance of food The problem appears to be in a fair way of solution for the hens of Macdonald College produce an average of 300 eggs per year, from one-fifth to one-fourth of which are laid during the rigors of the Canadian

The removal of ashes by conveying them to a waste bank hydraulically is done in connection with the temporary plant built to supply power during the construction of the Rainbow Falls hydro-electric develop ment of the Great Falls Water Power and Townsite Company on the Missouri River near Great Falls Mont The power house is on the side of a hill directly above the edge of the river bank. The bituminous coal of the river bank. The bituminous coal used is dumped by gravity from cars on a trestie to a bin at the rear of the firing floor of the boiler room and runs down on this floor, from which it is fed by hand to

the furnaces As the sakes fail through the concerds the they are drawn out into a innaverse concerds lined trench in the firing floor. This trench is aloped to one side of the building, where it connects with a funne extending on a grade of about 5 per cent to the odde of the river bank. When the grades are cleaned the sakes are pulled into the trench and a lose stream turned into the latter to start them. They are thus picked up by and carried out in the river through the flume No difficulty is experienced from clogging in the trench or flume and the current in

# THE EARLIEST STORY OF THE DELUGE

## PROF. HILPRECHT'S REMARKABLE DISCOVERY

other onsection version that far manythad.

The work of Fred Hilprocht is of the commentation of the Nipur tables. Spot valid to the Nipur tables. Spot valid to the total process of the commentation of the Nipur Index Spot valid to the Uv of the Challege?

These Fred Rifferent's recom-mentation that my discoveries be made accordable to the attention would as quickly as penalties, as pages by his has recently been published by the University of the University of Pannaylynas.

A "Office" Burlyonian Expedition
integral-writery of Passany'rania. Series D; Resign and Treaties. Vol. V Passiculos." Prom
'giber for hollowing abstract is made:

"Office to the passion of the University of Passanyi
Burth aspectition of the University of Passanyi
to hippor, Prof. Ettipepake transition was about to hope to the passion of the p of the country. This fragment was so completely

PROBE AND ROOM VIEWS OF THE MIPPUR VERMON OF THE DRIVOR.

BATE, APPROXIMATELY, SIGN R. C.

Series D: Retifection." From subsection of the series of to uncorer one cuneurum and other deposits of hard-ened drift without damaging the writing below, until its had completely deciphered every sign. The frag-ment proved to be a somewhat incomplete but unmis-tabable second of the Delugs about 1800 years under think sheller fragments obtained from the library of shifterhangal (684458 B C) and was inscribed more than 1805 years before the time generally assigned to Release, and even before the Patriarch Abraham re-

ment contains a portion of the di Nosh Ill us plabtim to construct a ship and to save life from the all destroying flood Apart from the tradition of a great flood handed down by the Babylonian priest Berosus (living between 3'10 and 250 B C) but preserved only in ex tracts by other ancient wr there are fragments of three writers tinct Deluge versions in cuneiform

The first of these is the version from the library of King Ashur banapal (668-626 B C) which was restored from a number of frag veh, and which is an Assyrian copy

of a Babylonian original
The second is a somewhat dif forest version of the Babylonian Deluge story and is found on Fragment "D(ally) T(r)egraph)

42," which likewise came from the royal library of Ninevoh and was inscribed about the same time (c 850 B C)

The third fragment is that acquired and published The third fragment as that acquired and pusinents by Prof Scholl of Paris, and now in the possession of Mr J Pierpout Morgan It is dated "in the year when King Ammi-adduga built Dur-Ammi sadiuga at the mouth of the Euphraties," i e, the eleventh year of his government, in other words, according to Prof Hilprocht's reduced chronology, about 1968 B, C.

As examination of the cuneif fragment and a comparison of this new version of

the Babylonian Deluge story with the parallel pas-sages of the two Nineveh versions and the Biblical story have brought out the significant fact that, with due allowance for a general resemblance b the three cuneiform versions, the Nippur version of the divine announcement of a great flood and the command to build the ark differs fundamentally from the two Ninevah versions and agrees most remark-ably with the Biblical story This agreement affects that part of the Pentateuch (Gen 6 13-20 8 11) which Old Testament critics style P (= Priestly Code) and generally regard as having been "compiled in Babyionia about 500 B C" The importance of this new text to theological students cannot be overrated Written as it was about 2100 B C, this new version came into being at a time when the sanctuary of Enili at Nippur was supreme among the Babylonian temples and was the center of Hersture When Hammurabi, the Amraphel of Genesis 14 conquered Rim-Bin of Larse, the various petty Habylonian states con site of Larsa, the various petry starpionian states con-stituting accomplically the ancient kingdom of Shu mer and Akkad were united politically by the con-queror Babyion on the kuphrates became the ma-tropolis of the united empire. After Ammi-ditans the third successor of Hammurah Nippur disappears implify from history. It respicars with the rise of third successor of Hammurahi Nippur disappears rapibly from thistor I frespients with the rise of the Casaite dynasty in Babylonia about 1400 B C, and its sanctuary again rises to hold a completion place for several centuries. The revival is but the last flicker of a fast dying flame

In Prof Hilprechts opinion the Temple Library at Manue was a most insignificant institution after Nippur was a most insignmean institution street 1909 B C, and it indurshed most giorlously before 2000 B C. The priests of the Cassite and Neo-Rabylonian periods produced few, if any original literary com-positions of value at Nippur

mere delighting in the stateent at the end of their tab lets that the text was "a faithful copy of an old Nip-pur original". The literary activity of the priests was transferred to other centers like Rabyion and Sippar is therefore evident that the dippur fragments, antedating the two Nineveh versions by 1500 years, represent the old est version of the Babylonian Deluge story in a Semitic translation, made doubtless from a much older Sumerian original which has not yet been discovered and that the been discovered and that the later cunciform versions are different editions of the same story with consider-able changes, abhreviations, and additions The Doluge story of the so-called "Priost by Code" pust form user of ly Code" must form part of the oldest traditions of Is-tael as Old Testament schol eve pointed out

Even the Amarna period ut 1400 B C) with its nditions in Pales

tine, when the influence of Babylonia upon the shaptime, when the influence of Embylonia upon the snap-ing of the government and the religious conceptions of Palentine was almost all cannot explain its pres-ence in the Old Testament. The only period when the oldest version of the Deluge story could possibly have entered Cansan was the time when Abrabam, whom Prof Hilprecht regards as an historical per sonage, left his home on the Kuphrates and journeyed westward, in other words, the period of the first dy nasties of Isin and Babylon of which Hammurahi or Amraphel is the central figure, the time when the Amorites knocked at the gates of Babylonia, invaded ne country, and soon overthrew the old dominion Although the interpretation of the Nippur tablet

is by no means easy it can be stated with safety that in accordance with the exalted position held by Emili in the old Babylonian pantheon as "father of the it was in all probability Enill himself who warned Ut na-pishtin to take refuge in an ark Here then as in the Diblical version, the Lord of the Universe himself both causes the Deluge and saves Nonh from destruction by warning him and ordering the truction of an ark

present herewith in parallel columns the translation of the actual preserved portions of the ancient Nippur version and the corresponding passages of the Old Testament according to the Rebrew text. similarity is at once arriving so much so in fact that the blanks in the Nippur version can easily be supnifed by the more complete account

The Current Supples

The current Supplement, No 1787, contains a most er of interesting articles. Karlerns ble numb Knatz writes on the modern use of police dogs, and Raymond on quantitative and qualitative think ing. Prof R. S Woodworth deals interestingly with the 'typical" man a creature who does not exist, but yet who is very necessary in the endeavor to classify

four world's records last fall upon the Brooklands track in England, and so it is not to be wondered at that

THE SOO-HORSE-POWER BENE RACER IN WHICH OLDFIELD MADE 196 00 MILES AN HOUR. A NEW WORLD'S RECORD

mankind A prominent place among the physical agents employed in modern methods of therapeuties has been occupied for the past decade by light and especially by electric light, which is used chiefly in the form of "light baths" and is furnished by are and incandescent lamps separately or in combination Dr Theodor Schueler reviews these modern thera peutic agents in an article entitled 'Electricity and Light in Modern Medicine' No name is more distinguished among modern astronomers than that of Prof G E. Hale, the foremost authority in the world Prof G E, Hais, the foremost authority in the world on the sun He contributes a brilliant article on solar vortices and magnetic fields, in which he critically discusses recent solar investigations, and effect in sun-post in a circuit resultant solar effect in sun-post in a circuit research, as in less ambitious affairs, the possession of a good imagina tion is often of the utmost value. There are reliable to the form of the sun of the sun in the ing schievements, there are equally few in which the authors of these advances have not owed a large measure of their success to the happy inspiration of their imaginations, all of which is discussed in an article entitled "Scientific Guesswork." Although the port of Swansea is piaced on the banks of the River Tawe, it may for all practical purposes be regarded entirely as an artificial port, the discharge of the river being trifling an compared with the volume of tidal water obbing and flowing between the pierheads. The peculiar conditions of that port have more the construction of a most wonderful dock, pos a water area of 5 acres in addition to the area the desp-water extension which, when it is on will add 40 acres to the total. This remarkship

is described by C Van Langumdelenh CC-L, & Blavettwrites on modern divelopment in Valley, distributions write on modern divelopment in Valley, distribution value of the contract and the contract and the contract and the contract the contract of modelenthen may be considered, but there is also nouse which when contract managered in more fertile of rescales in theorem, the considered in more fertile of creation in theorem, the current with the terrest har C B Guillaumn's excellent article satisfact the contract of the co fact that sorwe propellers are most deficient at a raise of speed on-literably lower than the rate of speed which is best for efficiency and accounty of turbine operation. To overcome these drawbacks Dr fi. Peetinger has invented a system for which be claimed to the control of the course of the control of the course of the control of the course of the cour aimple hydraulic transmission device, the socturbo-transformer G H Bryan contributes some ideas on the subject of aeroplane stability

NEW AUTOMOBILE RECORDS AT ORNORD BE wagain the famous sands of Ormond Beach have en used for making new rec ds with auto been used for making new records with automomies. During the three days' meet held isst week Barray; Oldfield once more beat the world's record for appear with his new 200-horse-power Bens rance, a picture of which is reproduced herewith. This may

> upon the smooth sands of Ormend it traveled two miles in the fastest time ever made by an automobile The distance was covered in 55 87/100
> seconds, which is nearly three
> seconds better than the record
> of 58 4/5 made by Demogeot of 08 4/0 mage up beam in 1906 with a Darraco The rate of speed trai by Oldfield 1s 1 128 89 leld **alb**o miles an hour Oldfield also made new records for the kilometer and the mile; covered the \$,280 feet of the first-mentioned distance 174/100 seconds. The pre-vious record was 1776/100 His record for the mile, which was made a week previously, was 27 38/100 sec-onds, a speed of 131 72 miles Walter Christle's front-drive ra r covered this distance in 20 29/100 seconds or at the rate of 118 46 miles

In the stock car races, Old

field made a new record of 40 35/100 seconds for one mile in a Knox machine. This make 4 car also won the 10-mile free-for-all in 8 41/100 minutes, a Chalmers 40horse-power car took second place, the 10-mile handi-cap was also won by a Chalmers car, which best the Pope-Hartford, the time being 12 minutes and 12 seconds. On the last day of the most, in the one-mile speed trials, Oldfield covered the distance in 27 88/100 The 10-mile stock chassis race for cars hav seconds. The 10-mile stock chassis race for cars having a piston displacement of 161 to 230 inches was won by Hart in a Buick in 12 minutes and 58 seconds, or at the rate of 46 27 miles per hour A Hud-son machine came in second In the 10-mile handicap a Darracq car driven by Kiracher wom in 7 21, Oldfield on a Knox was second and Bond on a Stears third. A second 10-mile handicap race was won by Altman on a Hudson in 12 45, Oldfield with a Ka

was again second, and Kirscher third.

In the one-mile speed trials the Darracq covered the distance in 37.24, and Walter Christic made it is 88.15.

While the races this year were not very numerous, idfield created a great deal of enthusiasm by him record-breaking driving, and it is probable that next year still other attempts will be made to reduce the time for short distances. The machine Oldfield used fa for short distances. The machine Oldfeld used fa the every way similar to a regular stock car except, that it has a much larger engine of 188 x 300 millimeters (7.3 x 7.8 inches hore and stroke, capable of developing considerably more than its rated horse-power.

A large portion of the old French plant at Panama was found to be serviceable, and is doing good work on the canal. Since 1906 the undess punk has been sold as evrap, and up to January, 1910, even ten they used tone have been shapped spid and.

the point important processes of life, there are assurely for an indefinite time at least.

An Braption of Rina

On March Mith the Sicilian volcano Stns began to erent. The lava united in a vast stream 24 feet high 1,200 feet wide, and at the time of going to prese threatening the destruction of Belpasso and

Bereilo. The lava devastated large tracts of cuitivated lands, such as vineyards and orchards, and has wrought haven in the woods. The village of Nidolo, near Nico-del, has been covered completely, and many huts and height deven have been destroyed.

BUILDING THE NUCE CONCRETE LOCKS AT GATUE, PARAMA. SPECIAL APPLIANCES BY WHICH THIS BUOK ANTIFICIAL

MONOLITH, 400 PEET WIDE, 4,000 PEET LONG, AND 90 TO 100 PRET DEEP, IS CONSTRUCTED

50 to 100 Peer next, is constructors.

The work at Phannan, and particularly at the great flight of double locks at Gatun, has now reached a stage at which the camera is able to catch some adquate impression of the titanic proportions of the work and record it for the interest of the outside world. We have all understood that the scale upon which work was being done at Phannan was impressively and the particular that the p sive, but it remains for the accompanying pictures to teach us just how stupendous is the mass of masonry which is slowly taking shape near the Atlantic end of the canal.

The locks at Gatun will pass vessels up or down The locks at Gatun will pass vessels up or down between sea level and the lovel of the lake which will be formed by the great Gatun dam immediately ad joining the locks. The total height of 85 feet will be covered in three flights of approximately 28 feet be covered in three flights of approximately 25 for each, in order to provide ample accommodation for each in the control of the control of the against total disablement of the locks, they are being built in duplicate, as aboven in the plans herewith presented Each lock will be 10 feet wide, and will have a unable length of 1,000 feet. To provide against the carrying away of gates and the consequent rush of water out of the lake the former will be built in mum of 18 to a maximum of 22 feet, the size varying according to the number of side culverts that are served. Now it can readily be understood that the coat of a work of this kind, involving the handling of 4,000,000 cubic yards of material, depends very largely upon the amount of labor involved For it works of this character the cost of labor is the prin works of this character has cont about is the jirit clipal item, and honce much thought has been given to the design of the appliances for handling of concrete and the huge "forms (temporary in losing walls) within which the concrete is deposited. At the Gatun locks the sand and stone are deposited. the Gatum locks the sand and stone are deposited from cars in a stock pile running parallel with the lock site. On either bank above the buge excavation of in which the locks are being built are a series of lufty style towers (see front page and Pine. 2 and 7), which the buckets containing the materials are trans-ported The converted spitched up by these calles run over the excavation and lowered at the desired point. The first part of the concrete work consisted in the laying of the huge slab of concrete, 392 feet wide

and nearly 4,000 feet long, with a maximum thickn of 20 feet, which forms the floor of the locks. Dur-ing the construction of this floor, care was taken to provide circular transverse conduits with vertical openings through the floor which led alternately to opposite side walls, there to connect with the main longitudinal, emptying and filling conduits. The next task was to erect the side

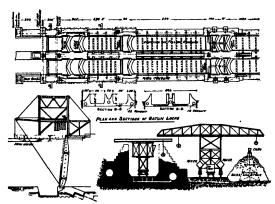

walls, and it is this in-teresting work which is shown so clearly in the accompanying tion

The walls are built in sections, each of which is about 40 feet with, with a space of about 30 feet between them ? The by filling in the interven-

ing vertical gaps
It is well understood that one of the most ex pensive elements in con crete construction is the building and manipula-tion of the forms in which the concrete at a lin smaller structures these are composed of timber, but because of the huge amount that would be required and the big depresiation in the value of the timber after use this material was altogether out of the question The plan adopted is shown very clearly in our illustra The forms are tions The forms are built entirely of steel (Figs 2, 4 and 5) Those for the inner ver-tical face of the walls consist of a series of massive steel towers of triangular cross-sec-

a triangular crosses to the vertical face of which is riveted wall of size plating, stiffened by horizontal channel irons. The towers are carried upon four 4 who i trucks, two under the front and two under the rear fare, which run upon two pairs of rails laid on the floor of the lock and parallel with its longitudinal axis. The rear face of the walls, which is stepped, by a series of separate rectangular measuring about 6 feet on the vertical and 4 feet on measuring about 8 feet on the vertical and 4 feet on the horizontal face. The ends of each wall section are closed by means of sirel plates supported against vortical movable framework. Into the pocket as thus formed the concrete is dumped from the akips of the overhead cable, and tamped into place by the labor ers, until the full 6 feet of height corresponding to the height of the rear stepping is completed walls are thus carried up three at a time until they have reached their full height. This work is very clearly shown in the front page engraving, where a skip is shown as having just delivered its load and the laborers are spreading and tamping the concrete To amist in making a firm joint between the mono to maint it making a nim joint petween the mone-lithic sections, vertical and horizontal key ways or pockets (Fig. 5) are formed in the abutting faces, which pockets are, of course, filled in with concrete wasen pockets are, of course, filled in with concrete as the intervening gaps between the walls are built up. This system of keying, coupled with the natural adhesion of the concrete, will prevent any tendency to cracking or separation of the walls at these points under hydraulic or earth pressure or under the rack ing strains of an earthquake shock

A most interesting piece of steel form work is that

per-exciton of emergency date in the tion, with wicket girders down an gates partly in the lowered pos

Diagram showing method of building the locks — Sand and stone are lifted from the stock pile to the mixers, and from the mixers the concrete is carried to the lock side by the two cantilever grains

How the 4,000,000 cubic yards of concrete are being mixed and built into place at the Canal locks. BUILDING THE HUGE CONCRETE LOCKS AT GATUR, PARAMA

duplicate, with a considerable space of water bet them, so that if a ship, overrunning, should strike the first gate, the second will remain intact. Also, at the estimate to the upper lock, there will be a huge swing bridge which, in the event of the gates being carried away, can be swung scross the lock entrance, and a series of horizontal, vertically sild catrance, and a series of horizontal, vertically sile ing steel gates lowered down from the bridge, thus effectually shutting off the flow of water. Heavy fender chains will also protect the gates by receiv ing the first shock of a collision and thus, partially

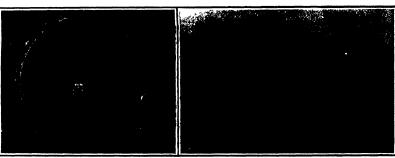

if not altogether, absorbing the momentum.

But the present story is concerned with the methods which have been adopted for building this huge monolithic, or unjointed, mass of artificial masonry, into the construction of which will enter about four monolithe, or unjested, mass of artificial masonly into the construction of which will state about four million cubic yards of concrete in general, the locks may be described as consisting of a floor, 400 feet by 3,500 feet in area, and of 25 feet maximum control of the contr for forming the 18 to 22 foot conduits in the side walls. It consists of a flexible steel pipe (Fig. 1) heavily braced to reside deformation, which has a longitudinal hinge at the top and at the bottom is provided with heavy left and right serves by which the form is found to 10.00 ft. the serves by which province with heavy left and right serves by which the form is kept to list full dimension during, the lay-ing and setting of the concrete. For remove the forms, the serves are turned and the bottom edges of the forms are drawn togs ther thus reds in it, the dimneter and allowing, the form to be drawn clear of the

conduit
A most interesting picture is Fig. 3 showing the work at the entrance to the locks from Gatun dam. Forther that it is seen the rear stepping of the easterly

wall of the easterly lock. The circular timber work shows the position of the upper end of the first lock. Just beyond this are two sections of the steel forms for the main central conduit by which water will be led from the lake to the upper lock. Just beyond the wall which extends across the picture to the right-hand bank will be located the emergency dam above hand bank will be located the emergency cam above referred to, and beyond that will extend the three plers which will form the lock entrance from the lake. The embankment which will be seen running out as an extension of the natural bank to the right out as an extension of the institute south to the picture is the rock fill forming the south-crly toe of the great Gatun dam, which extends to the right across the valley to a junction with the

distant bills. The lake of wining usen so the right of the rock embankment is (epined by the hydraulic dredges which are being using in making the Gatten dam. Half a mile to the nagrib, also extending across the valley from the northerly and of the locks, a similar rock fill, and hung dredges are now engaged in pumping silt and water From the Chagras and from the various contiguesse channels, into the high beain half a mile wide and over a mile long the beain half a mile wide and over a mile long the locking the first firs

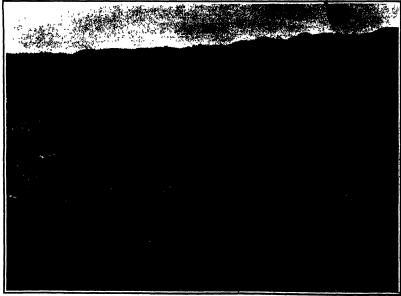

The condults are formed in the body of the side and center walls. The forms consist of collegeble steel cylinders, himsel at the top split at the bottom and kept in place by tiggright and left screws. The latter are lossened when the concrete has set, allowing the two halves of the cylinder to swing inwardly and be withdrawn.

Fig 1 An 18-foot conduct, for emptying and filling the locks

# HE HEAVENS IN APR 🍱

BY HENRY NORRIS RUSSELL PH.D.

HE great comet which was so con apknous in January is again observable in the morning sky, just before daylight but only with telescopic aid Its orbit is now well determined and it appears that it was nearest the sun, at a distance of 10,000,000 miles, about the time of its greatest brightness, and that its

and fading was due to its steady recession from both earth and sun its orbit is probably very nearly parabolic. That it could not be of short period was clear at the time of discovery for so bright an object could not have escaped being seen often before, if it had come around at moderate intervals like Hailey's comet

The latter is invisible behind the sun during the early part of April, but is well placed for morning the

time it appears almost stationary in the heavens south of the eastern edge of the great square of P gasus and is high crough to be observed befrom 158,000,000 miles on the 1st to 77,000,000 on the 70th, and its apparent size and brightness will stead-ily increase. By the end of the month it will doubtless be conspicuous to the naked eye

While waiting for this, we will find abundant occupation among the stars. Hefore we trace out the constellations into which the imagination has grouped them, let us study a real family of stars, whose relationship has but

recently been discovered
It has already been told in these columns how Prof Boss has identified about forty members of a group of stars in Taurus which are keeping toother in their mo through space like a flock

of wild gross in the air It has also been know for some time that five of the bright stars of Great Boar form a similar group, and recently, through the studies of two German astronomers, Lu-dendorff of Potsdam and Hermprung of Göttingen, it has been found that several other conspicuous the sky, also belong to it.

(se say, asso belong to it. All these stars are really moving in the same direction, and at the same rate, and hence they all appear to be moving away from the same point in the heavens, though in quite different directions, for some pass our system on one side and some on another. They our system on one side and some on another They cought on this hypothesis still to be approaching us, and the stretrescepe shows that this is actually the case the observed velocities of approach agreeing cleanty with those predicted by theory. The stars of this system are shown on our map First come the group in Uras Major—the stars S, 4, can(4, all in the Orest Dippro—with Airs P, the A; can(4, all in the Orest Dippro—with Airs P, the A; can(4, all in the Orest Dippro—with Airs P, the A; can(5, all in the Ore

\$\ a\$ and \$\(\chi\_a\) all in the Greek Dispers—with Alter' the small companion of Mins (7), and since two cher stars not shown on the map, one of them about a degree from \$\chi\_a\) at little above the line joining it to \$\(\chi\_a\) and the other the northernmost of two fifth-engatited stars not quite half way from \$\(\chi\_a\) tower of which later star is shown on the map north of \$\(\chi\_a\). All these eight stars are relatively about as close together as they look to us, and ure at about the same distance from our sides return—the \$\(\chi\_a\) this high-years where the properties of the properties, the motions of all these stars appear to direct with the output of the Minster, and in the directed to on the bordson of the Minster, and in be directed is on the borders of Ursa Major, and is pointed out by a line from # through x Ursa Majoria,

carried as far again. The other stars of the group are also directed away from this point, though they are also directed away from the point, tought hasy are widely scattered over the sky Two of them are nearly in line with the stars of the Dipper, though far removed on each side—\$\beta\$ Aurigas and a Corona. The former is the remotest of the group, about 160 light years away, while the latter is about as far off as those previously described

as those previously described
Farther southward, In quite a different direction,
is the star 3 Leonia, whose calculated distance of 389
lighty-years puts it much nearer than these of the same start would be destribed Finally, and most remarkable of all the splendid filtrus is undoubtedly a member of the same group It owes the brightness to its relative nearons to us—only 3½ lighty-years according to the demands of theory which in this case is offered from the demands of theory which in this case is offered from the demands of theory which in this case is offered from the demands of theory which in this case is offered from the demands of theory which in this case is offered from the demands of theory which in this case is offered from the demands of the order of of the or

we may fix our eyes first on the Negt tle Bear, to which this belongs, whill most conspicuous groups, is easily by most conspicuous groups, is easily hy-a tolerably good "Dipper," though less phrase may be pardoned) than its in The figure of the Bear, as shown in e hardly be made out except that the list ing in Polaris makes quite an unas Polaris itself, apart from its positis as a double star, observable with while the spectroscope shows that the two is attended by two invisib with a period of loss than three da

NIGHT SKY: MARCH AND APRIL

When the actual brightness of the other stars of the system is computed it is seen that Sirius is actually one of the fainter members of the system Its total light is about thirty times that of the sum which that of the Phincipal stars of the Dipper and of  $\alpha$  Coronae averages fully twice as much, and that of a Aorigas is about ton times as pright, and the star of the star o bright.

This system therefore consists of unusually bright are It is remarkable also for the great extent in stars It is remarkable also for the great extent in space Between the cuter fars of the man particular must be hundreds of stars, of which one particular which have no connection with it. It is at it as man which have no connection with it. It is at it are made which have no connection with it. It is as it as most man you will be a supported event and the man speed. Though many of the crowd intervane, the mare fact of thelm progress toward the same point agrees to destinguish them, and is a mark of their common original It may be added in conclusion that a very large proportion of these stars, at least six out of the tem aboun on the map, are either visually or species equically double. Turning now to the constallations, dam

### NOVEL CHANGEABLE PHOTOGRAPHS

BY F. HONORE

Frof. Lippmann recently described before the agademy of Sciences at Paris some novel changeable photographs made according to a method devised by M. Estanave, accretary of the Faculty of Sciences of

Soping woman. By inclining the picture a few milli sters and rocking it slightly, the eyes apparently that like the eyes of a porcelain doll, with the ex-The the eyes of a percentan doil, with the eyes, by were, that the entire face livens up in the extraordinary manner incline the picture of set the eyes alowly close again. The photographs when reproduced for publication in a paper when the set the Scientific American unfortunately cannot be send to obtain the offect because of the new control of the control of the product of th not be used to obtain the effect because of

In order to explain how M Estanave obtains his sisture, let us consider two different photographs. assure, let us consider two different photographs-the one D representing a sleeping woman, the other If the same woman awake Each photographic posi-tive is ruled horisontally from top to bottom, so that both photographs appear finely banded if we refrom the positive D even alternate pairs of bands, and from the positive E odd alternate pairs of bands, and if we place upon the positive D the bands taken from E and upon E the bands taken from D, we will obtain two new pictures which w may designate  $D^1$  and  $E^1$ . These new pictures  $D^1$  and  $E^1$  are composites of D and E. If the bands are narrow enough, 30 per centimeter for example, their

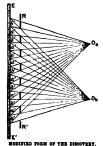

THE SLEEPING WOMAN

discontinuity will not be noticed. The composite pictures will apparently be complete and comparable with the half-tone pictures to be found in the Scien-TIVIC AMERICAN OF IN any other modern illustrated

Let us now combine the two composites  $D^1$  and  $R^1$ In other words, let us transpose strips of  $D^1$  and

strips of E<sup>n</sup> without disturbing their order. We obtain still another positive D<sup>n</sup>, formed by the combination of the two preceding positives. When looked

at directly this new positive  $P^{\varepsilon}$  is rather confusing, but when looked at through a glass plate ruled altornately with horizontal opaque and transparent bands of a width equal to those constituting the positive itself quite a different effect is obtained. If we hold this glass screen in such a manner that the opaque bands cover the bands of the positive E' we will see only the bands of the positive D, and we will obtain the portrait of a sleeping woman. On the other hand, if the screen be slightly shifted so that the bands of if the screen be siightly shifted so that the bands of the positive E' are covered we will have a portrait of a woman wide awake Since the different effects are obtained simply by shifting the screen, the single photographic view seen through it can be caused to hange its appearance very rapidly simply by chang

ing the speed of the screen moves in actual practice the ruling of the positives and in actual practice the ruling of the positives and the transposition of the bands, as well as the use of a suitable screen, is attended with consider able difficulty For that reason, M Estanave has devised a simpler method which is illustrated in the accompanying diagram

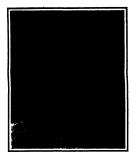

companying diagram
Let a and b be two different objects the luminous
sys from which fail upon a sensitive plate or a
round glass HS In the path of these rays at a ground glass BE In the path of these rays at a suitable distance, the horizontal ruled acreen RR is placed in the diagram the spaces separating the lines of the screen are considerably exaggerated and the screen itself is shown in vertical section. Such is the position of the screen that the sensitive plate will receive a series of images of a alternating with

In making the positive photograph according to this method, the subject is first placed at Og and then at Ob At Og the subject must appear asleep, and at Ob wide awake A composite picture will be obtain on the sensitive plate If this picture be examin

through a screen similar to that by means of which the picture was made, and the visual angle be varied either by shifting the eye or shifting the serven the portrait will apparently open and close its eyes

Theoretically several different pictures can thus be Theoretically several different pictures can thus be superimposed. In actual practice M Estanave has combined three which are clearly visible However there is a limit to the number of pictures that can thus be combined for the positives become more and thus be combined for the positives become more and more incomplete as the filtrem bands composing them are more and more elongated in the case of two aspects, the elements of an image are adjacent, the one to the other with three aspects, the consecutive elements of an image are separated by two elements belonging respectively to each of the two other images and so on

In order to simplify the adjustment of the screen relatively to the composite image, and in fact to avoid adjustment entirely M Estanave employs an improved autosetroecopicy late which he has in vented. This plate is ruled with a serven on the side which is not emulsfield, the rulings being such that alternate opaque and transparent bands are produced The new invention of M Estanave's is so con-ocived that the plate serves a double purpose. The plate is mounted with the ruled surface in front, or plate is mounted with the ruled surface in front, or it can be so plated that the ruled surface is either horisontal or vertical. When the ruled surface is placed horizontally changeable photographs are ob-tained. With the ruling vertically placed images can

TRE WARING WOMAN

be obtained directly visible to the eye with a store scopic effect. With two stereoscopic lenses mounted so as to obtain fillform images formed by the super position of the two images of the object taken under the same aspect, the vertical lines of the screen select for each eye the particular image of the stereo-scopic couple which are intended for it

### Mother-of-Pearl Imitations,

At a very early period repeated efforts were made to replace mother-of-pearl, so expensive at times, by some substance possessing the same valuable proper-ties, but the results arrived at always fell far short of the expectations which were entertained, and these of the expectations which were entertained, and these attempts were, therefore, gradually entirely aban-doned Recently attention has again been directed to the same problem, it being believed that the progress made in chemistry and applied science afforded grounds for hoping for more favorable results. And, in fact, some of the imitations of mother-of-pearl now in fact, some of the imitations of mother-of-pear how made seem to show that these expectations will not be disappointed. It is true that hitherto but few detailed directions for making artificial mother-of-pear have appeared in technical literature, for the simple reason that the methods which have led to successful results have for the most part been kept carefully secret, but a careful study of international carefully secret, but a caseful study of international patent literature shows that there are now various processor for making these institutions, sees of them resting on a solid scientific basina. It is at once wri-dent that imitations such as sheet guidates except in flabbacks conserv. or Cologon gives asturated with abstraction silver will never gain a footing as goodine substitutes when, for instance, not even the well-staging, equilated mother-of-pears can gain recognition,

as an equivalent. The purpose to which artificial as an equivalent. The purpose to which artificial mother-of-pearl is applied determines the degree of its efficiency as a substitute, and this degree of efficiency in its turn depends mainly on its external resem-blance to the natural product. For combs, has join heads, etc. celluloid mother-of-pearl may be used without hesitation as an imitation, for ornaments, on the other hand, such as fastening pins, buckles, etc. the preference will naturally be given to substances whose external resemblance to the genuine material is complete or nearly so Special interest, therefore, atexternal recombinate to the guntile material is com-plete or nearly so Special interest, therefore, at-taches to a new method of preparing artificial mother-of-pearl, which we proceed to describe in detail The ascertained fact that collodion, mixed with car-

bon bisulphide and a few parts of pearl-silver fluid, yielded a substance more or less resembling motherof-pearl, led to a method of working directly with of-pear), led to a method of working circetty with cellulose solutions, and in this way the celluloid mother-of pear! airway mentioned was obtained a material which has been used for a variety of pur-poses in the industrial arts. As, however, the in-formability of celluloid considerably restricted the employment of this new material, efforts were made employment of this new material, emorts were made to replace collubid by another substance. This sub-stance was callife. The process of preparing artificial mether-ed-pearl from this base is as follows 100 parts at callific dissolved in 80 to 100 parts of glacial social

acid or chloroform are mixed with 20 parts of call cined magnesia and 4 to 8 parts of pearl essence, with cined magnetia and 4 to 8 parts of pearl reserve, with continual stirring. In this way a more or less visal mass is obtained which is allowed to dry in the air if a few drops of carbon blainhide are added to the liquid solution a beautiful iridewest inster is imparted. As cellit dissolves comparatively slowly, it is advisable to prepare the solution aday or two beforehand Is case of need, the process of dissolving may be somewhat accelerated by slow heating in a water-bath. When dry the artificial mother-of pearl presents the appearance of polished mother-of pearl plates but in addition it is distinguished by great ductility and elasticity. The treatment of this artificial product is, therefore much easier than that of genuine mother-of-pear! It has also been attempted to substitute mother-of pearl dust for magnesia and very satisfactory results have been obtained in this way it is also possible by means of this process to produce artificial pearls exactly like real ones for this purpose the artificial product is propared in rather thick plates from which allow are cut and pearls of any desired size and form turned on the Those pearls are superior in point semblance to the natural product to the fish or wax pearia hitherto made from glass and are not so brittle as the latter — Deutsche Goldschmiede Zeitung

### NOTES ON OVERHAULING A BO BY ALBERT F. BISHOP

Square Bunging for Boats.-- I think square bungs are a big improvement over round bungs. They do not weaken the planking or chafing streaks and may more quickly be inserted

The chaffing strick on a round stern that has been bunked with round bunging invariably breaks sooner to later a her the round bungs have been insorted Whyre the square bung is used the nail is driven and

SQUARE BUNGING

set. The square punch which is a trifle larger than set The square punh which is a trifle larger than the nail head, by them driven in making the aperture for the square bung. This punch should be hardened and ground in an oneary whee I making the corner just us keen and sharp as possible. Obtong rectanguists bungs are professible where the boat mail is used in planking etc. The bungs are quite easily made \$\frac{1}{16}\$ of an inch sequero with a small bung aw, Utiling the saw table slightly to produce the taper on two

sides of the bung

Wheel Calker—The wheel calker illustrated herewith will easily force cotton into solid wood where with will easily force cotton into soils wood waters there is no some or joint. The shape gives one con siderable leverage. The cotton is first placed along the seam by attaching it with the point of a knife at short distances, just enough to keep it in line with

It is now ready for the knife shap which calks it very rapidly Take a strip of iron % by % inch thick, 2½ feet long and bend it to a flaring Ushape The bottom of the U should be 4 inches across and to it the wheels are riveted The iron strip should be drawn down a little on the ends to receive smould be drawn down a little on the ends to receive the handles. The wheels are 1% inches in diameter One of the wheels has a square edge 1/18 of an inch thick. The other wheel is 3/16 of an inch thick with the edge sharpened like a knife. There is a simple gauge placed on the framework near the square edged wheel which allows one to force the cotton to the desired depth to receive the putty

Marking the Water Line on a Boat -Level the boat Marking the Water Line on a Boat—Lavel the beat athwartships and decide where you would like your water line, which in the case of a launch or small motor beat should be from two to three in these out of water when the boat is affect. Take two straights to depen 2 or 1 feet long placed level athwartships to the boet one at the bow and one at the stern at the beight of the water line decided upon Struck a

MARKING THE WATER LINE OF A BOAT.

cord across the straight edges with the weight at each eng to keep it taut and let it just touch the blige of the heal The proper way to make a true line swith the bull a thin batting 7 or four inches wide and 10 or 12 feet long with the upper edge pressed against the boat to correspond with the dots. Re particular to keep the batting exactly plumb edgeways and you can correctly

scratch in your water line.

Simple Method of Weighing a Boat.—Take a lever six or eight feet long, place a fulcrum on the ground

now the bow Let the fulcrum (at 2 in the drawing) be just six inches from the end (1) of the lever that is under the bow of boat. A person that would well, say a hundred and fifty pounds, should work along on the lever, may to 3 or until the weight of his body would just lift the bow of the boat clear of the block With a piece of chalk make a mark on the lever is point. Divide the distance from the fulcrum at this point. to the chalk mark into 8-inch spaces and add 150 pounds for each space. For instance, eight space

WRIGHTER A BOAT WITH A LEVER

would mean 1,200 pounds, which would be a little le would mean 1,200 points, when would not a little less than half the weight of the boat, as the bow end is generally the lighter Now raise the stora with the lever in the same manner. The boat boing heavier at this end will call for more spaces. When this weight has been determined add the two weights and the re-sult will not be far out for the entire boat. The blockings the boat rests on while the boat is lifted should be at the extreme end.

A Home-made Lifting Jack.—The jack here illus-

A Home-made Litting Jack.—The jack here illus-trated is made with a screw an inch in diameter and eight or more in length and a good heavy but, the corners of which have been notched down with a file to receive a heavy washer The part of the nut which comes through the washer should come through far

A HOME-MADE LIPTING JACK.

nough to allow for good heavy riveling on the wa enough to allow for good heavy riveting on the washer This makes the base for tife nut to rest on and it is then placed on a worden block, which is well secured with four wood serves. The base of the jack is a heavy block placed with the grain running at right angles to the upper block which holds the nut. The cap and lever require no description. The broad beas revents the black from settling in the earth and from capaixing as well, which is a good feature ground boat

A Home-made Wheel Puller -- A simple wheel puller can be made by taking a piece of maple about  $3\frac{1}{2}$  inches square and about sixteen in length and fitting it with the bolts about as shown in the accompanying The nut for the center screw has the

HOME-MADE WHERE PULLED.

attached to it in the same way as in the lifting jack and it is similarly attached to the maple. The wheal to bolic carry two bread suits to catch on the rear face of the web or apotes of the wheel. The wheel is shown in dotted lines. This service is often recorded to in removing wheels (rong gaselline engines. This is—insert and the lifting look have been in use four or five years. William Aller directions for maintage details full per-directions for making eight different de colls, wrying from a causil one giving a mil-inch oppris in a large one giving to the sparks. The dimensions of eight and every was to the smallest group are given, and the rightess are written in language outly con-tryling and written in language outly con-

then the second group of the process of the compensation are within a band of the process of the

Polonium was the first of th substances separated from pit residues by Mms. Carle. Vario ods of come lonium mixed with blemuth obtained many thousand time ive than uranium. March Ive than transum. Marawama isoparated from 15 tons of pitchble about 3 milligrammes of intensely ive material which he called radii lurium, since it was separated nit with tellurium as an impurity. By with tellurium as an inspurity. By dip-plut a copper plate into a solition of this sinkstance, he obtained a deposit sig-weight not more than 1/100 milligramme, which was far more active than an equal weight of radium. It was soon recop-nised that this preparation was identi-cal with polonium, for it gaze off the typical a radiation, and had the charac-teristic rate of decay of that substance. Unfortunately, Marckwald was not aware at the time of securation of the areast Unfortunately, Marckwald was not swars at the time of separation of the great importance of testing whether jeed appared as a product of transformation of expensed as a product of transformation of the major of the product of the second of the sumerous of the sumerous of the second of the sumerous of the second of the sumerous of the second of the se

radium series. It is hald/mansformed in about 140 days, emitting a particles dur-ing the process. Rutherford showed in 1904 the polonium was in reality a trans-formation product of radium itself. Ra-dium at first change in the emanation, and then successively into radium A. B., C. D. E. F. radium F being identical in all respects with the polonium directly apparent of rom a radio-active mineral. When the radium commands in allowing the con-traction of the radium of the radium of the radium of the to decay in a sender giass then, the walls When the radium emanation is allowed to decay in a socied giass tube, the walls of the tube are coated with an iavisible deposit of pure radium D, radium E, radium F, but the amount of the last to be obtained in this way is far too small to be weighable.

small to be weighable.

The amount of polonium present in any radio-active mineral can easily be calculated. Since the radium and polonium (radium F) in a mineral are in radioactive equilibrium, the same num-ber of a particles are expelled from each per second. Since polonium is half transformed in 140 days and radium in 2,000 years, the former breaks up 5,000 2,000 years, the former breaks up 5,000 times faster than the latter The maximum amount of polonism to be obtained from a minearl is in consequence only 1,5,000 of the amount of radium. In 1,000 kilogrammes of pitchbleade containing 50 per cent of uranium, there are present 170 milligrammes of radium. The weight of polonium is about 1,5,000 of this, or about 1,500 milligrammes, it is thus obvious that to obtain 1,500 of amilligramme of the present polonium, several tons thus obvious that to obtain 1/10 of a ml-ligramme of pure polonium, several tons of high-grade pitchblends must be worked up. The most natural source of polo-nium is radium D (radio-lead), which grown polonium and has a period of half transformation of about twenty years. Shope colonium breaks up about 5000. Since polonium breaks up about 5,000 times faster than radium, its activity, weight for weight, should be about 5,000

monomous times that of recurson, while recliums A operiod three minutes is must

weight for weight, should be about 5,000 times greater than that of redium. There is nothing surprising in this, for the radium emanation has an activity about 200,000 times that of redium, while radium A (period three minutes) must

Since polentum emits e particles, of its products of decomposition, as bit the other e-ray products, abould helium. The production of helium as a preparation of polontum has been served by Rutherford and Boltwood wred by Rutherford and Boltwood inchester Lit. and Phil. Society, No-ber 30th, 1909), and also by Mme. is and Debisrae in their present ex-ments. Boltwood several years ago pasted that the end product of the tim series was lead, and has collected reaum series was sead, and has collected strong evidence in support of this view by comparing the amount of helium and lead in old radio-active minerals. Since polenium is the last of the active prodpotentium is the last of the active pro-nots observed in the radium series, it is to be expected that polonium should be transformed into belium and lead, one atom of polonium producing one atom of helium and one atom of lead. This of helium and one atom or load. This point of view receives additional weight from consideration of the atomic weight to be expected for the end product of radium. Since in the uranium radium series, seven a particles, each of which is an atom of helium of atomic weight four, are successively expelled before radium are successively expelled perfore radium P is reached, the atomic weight of polonium should be  $7 \times 4 = 28$  units less than uranium (atomic weight 238.5). This gives an atomic weight of polonium of 110 5, and after the loss of an e particle, a final product of atomic weight 208 is -a value very close to the atomic weight

It is a matter of very great interest and importance to settle definitely whether polonium changes into lead. The whether polonium changes into lead. The evidence as a whole has long been in favor of that supposition. The outlook is very promising that the experiments of Mms. Curis and Debierne will settle or Mms. Curre and Designe will settle question conclusively. No doubt an interval must elapse to allow the polonium to decay before the final examination of the residual substance can be made.—Nature.

The Revolving Safe.

The revolving safe is the latest advance The revolving safe is the latest advance of the safe industry in its continuous contest with the burglar, who, in the most recent times, has taken to working with the cutting burner, which, by means with the cutting burner, which, by means of an exphydrogan or expresslytene fame, can cut through the heaviest armored sate in a few minutes. The revolving sate makes the employment of the cut-ting burner absolutely impossible. It consists, as Technische Rondachau de-scribes it, of a steel strong hox, closed on all sides, of polygonal section, arranged to revolve on ball bearings, and inclosed in a spherical compartment, built of strong massury and closed above and strong masonry and closed above and below with masonry, in such a manner below with macoury, in such a manner that the steel strong hox can revolve on its wortical axis, without coming in contact with the walls. In the inclusing macoury and in the strong box, doors are contrived, by means of which the strong box is accessible from outside, as long as it is not revolving, which would be the case for hartance during the business of the contact of the c is switched on and the strong box then
revolves at a uniform rate of speed uninterruptedly until a predetermined
period, to which a clookwork comected
with the switching apparatus is set, when
the moving mechanism is automatically
invitable off. While in revolution, the strong box is

With its revolution, the strong box is shearbirdy unamnitable. The silectric motor and the storage battery are placed inside of the steal chamber, cannot therefore be tampered with from cettalie; any interruption of the revolution, so matter how embead, and any decrease in the placed of the revolutions, is amounted at man, with the sid of alarm devices, and the material strength of the material strength of the substitutes should have accounted in the material strength of the substitute through the findings generately they cannot extract the consistent painting strength of the substitute of the subst

## PENNSYLVANIA RAILRO

### Bulletin,

### DREADNAUGHT CARS.

The nub of railroading is first-class equipment and reliable service. The Pennsylvania Railroad provides this for the public. For many months big all-steel coaches, built like Dreadnaughts, have been operated on all through trains. Their casy-riding qualities and steadiness of motion have been widely praised. The all-steel dining cars too have distinct advantages over the wooden ones. They are stronger and steadier, and the act of eating is made more enjoyable by the smoother movement.

There are also some steel Pullman Cars-Combined Parlor-Smokers and Baggage-in the service now. Travelers like them, They have plenty of elbow room and they glide over the rails. The Sleeping Cars are coming Some four hundred parlor and sleeping cars will be in use by Summer.

The steel coaches and cars are the strongest vehicles ever built for passenger transportation. They are fire proof, break proof and bend proof. They represent the climax of safety and the perfection of comfort in railroad travel.

The Pennsylvania Railroad has always been the leader in all manner of improved equipment as well as in all methods of making their patrons more comfortable. This is why it is known and honored as The Standard Railroad of America

The Action of Radium Respection Upon the Elements of the Carbon Group.

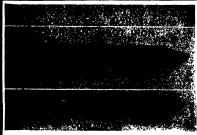

A lively sensation was created two ago, by the publication of Sir Wilyears ago, by the publication of the action of radium emanation upon copper Ac-cording to Ramsay, the energy released emanation rauses a disintegration of the atom of copper, and converts that metal into elements of smaller atomic weight, which are included in the copper in Mendelseff's classification Ramay claimed to have found, among the products of the action of the emanation upon copper, minute quantities of potamium, sodium and lithium Madame Curle repeated Ramany's experiments, but failed to obtain the same results, and pointed out certain possible causes of error in the method employed by the English physicist. Ramany has since repeated the experiments, taking care to peated the experiments, taking care to climinate these possible sources of error, and has reached the same results and conclusions as before. He has lately ex-tended bis researches to certain elements of the carbon group (sillion, titanium sirconium, thallium and lead), which, if his hypothesis is correct, should be dis-aggregated by the action of the same tion into simpler elements of the same group, and especially into carbon

The following method was employed by Ramsay and his collaborator Usher From a solution of radium bromide con taining 211 milligrams (about 3 grains) of the metal radium the emanation pro-duced in the course of one week, together with the explosive mixture of hydrogen with the explosive mixture of hydrogen and cargen which always accompanies it, was extracted by a pump The total quantity of gas thus obtained amounted to about 25 cubic centimeters, and con tained 0.0912 cubic centimeter of radium emanation, mixed with nytrogen, oxygens carbon dioxide and other gases. The hydrogen and oxygen were combined by explosion, reducing the volume of the gaseous nixture to ½ cubic centimeter. This was collected in a small glass tub-conted with fused caustic potash, which of an hour The residual gas was then introduced into a glass flask containing the solution which was to be subjected to the action of the emanation The con tents of the flask were left undisturbed for four weeks at the end of which period the activity of radium emanatio is completely exhausted. The gas was then drawn off and analysed

It was found to contain carbon dioxide invariably and carbon monoxide in some invarianty and carbon monotone in some cases. The following table shows the quantities of carbon thus produced from various solutions by one cubic millimeter of radium emanation

Hydrogen silicon fluoride H,SiF. 0518 Titanium sulphate Ti(SO<sub>i</sub>), 0982 Zr(NO) 9 873 Th (NO<sub>s</sub>), Thallaium nitrate Ph(ClO.). Lead objects

Rammay and Usher conclude that caris produced, in greater or smaller atity, from all the other elements of rarbon group by the action of radium nation. The elements of high atomic weight, with the exception of lead, which ems to be particularly stable, appear to disaggragated more easily than the ements of low atomic weight. Experiments on elements of other groups are in progress, but those described above ap-pear to prove beyond question that the atoms of the chemist can be broken up by the action of radium of Retue des Sciencisi

### **American Ingot Iron or Steel** Which?

TEEL is said to be the basis of our modern civilization. The corrosion test shown in this cut tells how insecure a basis it is. How much more secure life would be if what is now made from steel could be made from American Ingot Iron. How to make this new metal is a discovery of as much importance as the discovery of Bessemer Steel. American Ingot Iron is practically non-corrosive. Any thing made from it ought to last a lifetime. See that what you buy made of iron or steel is made of American Ingot Iron.

### LIEUT SHACKLETON

TOWEVER thrilling the average man may find Lieut Shackleton's modest and self-effacing recital of the Antaretic hardships and tri umphs of his brilliant expedition it is to th scientist that the English explorers character must assuredly appeal most strongly. No doubt the dare devil courage of the Englishman, whose love of adven ture has carried him into the heart of Africa, the wilds of Australia, and the mysteries of Thibet enters largely into Sharkhton a nature. How else could be have endured the numbing cold and the panges of privation? But the sacrifices made during that famous expedition which brought him within actual sight of the South Pole are exacutially scientific in character comparable with the herolam of the man who exposes bimself to the stings of disease-carrying insects, that mankind may know how best to protect itself as e ravages of yellow fever and the sheeping sickness His modesty of demeanor and speech his generous praise of those who accompanied him, his liberality in donating mineralogical and ornithological collections our museums (collections made when the desire was strong to abandon them in the hour of weakness and hunger) and above all that unwillinguess of his to appear as rival to Capt Scott his former chief, which has led him to postpone his own Antarctic plans so that Scott may have no difficulty in obtaining funds, are all characteristic of the unsolfish scientist in whom the sense of personal importance is overwhelmed by the high ideals of the cause in whose furtherance he is

Scientific too in its purpose is the expedition that Shackleton has postponed in deference to Scott, for that expedition will be undertaken not primarily to reach the Pole but to fathom the many mysteries of the unknown land fronting on the South Indian Ocean and presenting many scientific and geographic prob-lems for solution. By systematically exploring the coast around King William Land a coast which has never been carefully studied from shipboard because of float ing ice he will probably determine once and for all made by Admiral Wilkes to the first discovery of the Antarctic Continent Shackletons so use of fair play, his sense of scientific justice in other words, cul-nently fits him for this peculiarly delicat task. The hearty recognition whith Shackleton has ac-

The hearty recognition which Shackiton has accorded Party for the discovery of the vorth Pole coming as it does from a man who knoss something of the rigors of polar exploration outset to shame the Congress which is riused national honor to Peary without proof of the North Poles discovery. The doubt which has been footinhly said on Partys exploit by a congression whose "furthest north" as may Washington correspondent phrased it is the sent irreplat cold of coming when the constraints of the control of the contr

A FLEA FOR CO-OPERATION. city has reached a critical stage, for upon the element of the next few months will depend the question whether a certain proportion of future subway travel is to be paid for at the present rate of five cents per trip or at double that amount Non, it is generally agreed that one of the indis-pensable conditions of the future development of the pensible conditions of the future development of the subway system in this city is that the fare shall at no time exceed five cents, for which sum a passenger must be at liberty to travel from any one part of the system to any other. The universal todency today is toward the cheapening of transportation, and the possibility of an increase from five cents to ten cents per trip is not to be considered for a moment.

vertheless, the people of this city are to-day con ed with the possibility, if not the probability, o just such an increase of fare, and this condition is due in large measure to the strained relations between the Public Service Commission, whose duty it is to and the transportation interests of the public, and the Interborough (ompany which has a practical and the interference of company which has a practical monopoly of local transportation. The Public Service Commission will shortly call for bids for the construc-tion of an additional subway extending from the Bronx to the Battery, which will be absolutely independent of the route which is now in operation. The new line as laid out would be an excellent one, were it not for the laid out would be an excellent one, were it not for the grave defect that nowhere does it make connection with the existing subway. This defect however, must be made good by providing for such connections as will enable a passenger to travel for one fare from any point on the one to any point on the other system any point on the one to any point on the other system if we look at a map of the present subway route, it is evident at a glance that an extension of the existing lines north from Forly second Street through Lexing-ton Atenue to the Hronx and an extension of the Broads av line from Times Sausre down Seventh Avenue to the Battery, would provide the city with independent north and south routes The Public Service Commission long ago recognized that this was the next logical addition to make to the present facilities and they hoped that the Interborough Company would make a proposal for future extensions of their system over these routes Unfortunately, the company, in offering to build these lines, has obstinately saddled its proposal with a demand that it be allowed to build a third track on one of the elevated railways of

the Kost Side Now the city, as the Interborough Company very well knows has established for all time the principle that, since the existing elevated structures are a that, since the extensing elevated structures are a cell are ment of the streets in which they stand not only shall no further extensions be made but as soon as other facilities are provided, the cristing structures shall be removed Therefore, the Public Service Commission at once and very properly refused to ascede to the Interborough proposal, and, ostensibly, it is upon this question of extending the elevated service is upon this question of extending the elevated service intent the Commission and the company are all variance. Failing to get any satisfactory proposal from the Interborough Company, the Commission have laid out an independent route which extends from Woodlawn and Pelham Bay Park in the Bronx to the Harlem. River, and down Lexington Avenue and Broadway to the Battery Bids will shortly be asked and as we have noted above unless the Interborough should put in a bid agreeable to the conditions laid down by the Commission, the new line will be built independently of the existing subway Thereafter, if anyone should have occasion to make a trip involving a transfer from one system to the other he will be able to do so only by the payment of an additional fare—a condition which for a large proportion of the traveling public would amount to a positive hardship

Now the contingency of having to pay a double fare is so serious that it demands immediate and careful consideration. We believe that the exercise of a more policy by the interborough Company as recrai pourcy by the interporough company and the exhibition by the Public Service Commission of a lit-tle more confidence in the attitude and purposes of the Interborough people would result in a compromise of lasting benefit both to the corporation and the travel ing public. The Interborough Company certainly owes much to the city, and we say this with full remem brance of the fact that Mr Belmont, at a time when capital was looking askance upon the subway proposi-tion, came forward courageously and provided the enormous capital necessary for construction. He has received in the past and always will receive credit for the good service which he rendered to the city in for the good service which he rendered to the city in a very critical emergency. But having admitted this much, we cannot lose sight of the fact that events have proved first, that the subway property is senor-mously profitable and second that the terms governing the relationship between the operating comp and the city are very liberal indeed. If Mr Belm conferred a great benefit upon the city, the city has repaid him tenfold by providing the subway line with traffic far greater than was anticipated when the road was built

the Interborough, with its magnificently equipped system, its thoroughly trained personnel, its strong financial standing and its rich accumulation of operating experience, is obviously the interest best equipped to build and operate the new line, making it equipped to outle and operate the water, making it an integral part of its present system Provided it will give reasonable guarantees, the city would just as soon, and perhaps rather have the Interborough as soon, and perhaps rather have the Interborough people build and operate the new system than any other outside interest Unfortunately, the attitude of the company toward the rity in the past, as shown in its almost contemptuous treatment of the Public Ser-Commission, has had the inevitable effect of prothe company on the part of the public. This tunate, unnecessary, and, to those of us what stand what a really magnificent service, judgment. sast from the technical side, the company is ing, it is to a certain extent unjust.

Aren pil

The present juncture affords a great opportunity to the Interborough Company If it will only waite to never-to-be-granted demand for further elevated resinever-to-bergranted domand for further selvants "above facilities, the city will meet the company for a liberal spirit. Should the company put in a Md for he new line with a pledge to operate it as part of their existing system upon a single-fare basis, they will solve at once the problem of the present coagustion on their own lines, they will more standard to the extent of their already encouragely prefinable 5602 of operations, and they will place themselves mose proposed of the great city-accordance of the company of their spirit company, which will not be the least weighty of these above enumerated

### A REPORM IN METEOROLOGICAL SWITE,

N common with the other sciences, metaorology is burdened with a dual system of units. Great Britain and America continue, in a majority of their meteorological publications, to record rain-fall and atmospheric pressure in inches, wind velocity in miles per hour, and temperature in Fahrenheit dewas, while all the other nations have long a grees, while all the other nations have long sizes and option displayed and option displayed and option displayed and option the property of the size of the same respective measurements. There have of course been many projects of reform, but only very lately has uniformity actually been atland in any branch of the science of the limited States Weather Bureau of the British McIerrologist of Office have definitely adopted the metric of the science of the size of the size

system and the degrees of the Cer tigrade temp scale for recording the results of the observations made with kites and balloons—the former at its research observatory at Mount Weather, Va., and the latter at veral "aerological" stations now in opera British lales

The British have gone a step further The tempera-tures met with in the upper air are very frequently below the freezing point, so that the tabulated observa-tions expressed in the Centigrade scale, abound in negative values, which are awkward to deal with and also a fruitful source of errors in computation absolute scale, counting in Centigrade degrees from the absolute zero (-273 deg the absolute zero (—Zii deg C) has an engative values, and the use of this scale is now common in the discussion of many physical problems with which up-perally research is tiosaly concrended. For these rea-sons the Meteorological Office has begun using the absolute scale islase called the Kelvin scale) instead of the ordinary Centigrade scale in all records of tea-prature obtained by means of thick and ballooms. A no less radical reform has been introduced in the pub-lication of barometric pressure, in the same class of British observations The unit adopted is a C G S. unit of force, viz., the megadyne per square centimeter, in place of the familiar units—inches or millimeters in place of the laminar units—incase or millimeters— expressing the height of the mercurial column. As a matter of fact, the "mercurial column" is a pure fic-tion, so far as the observations in the upper air are concerned, the barometers attached to the kites and balloons always being aneroids, and it is much less important to know the height of this imaginary colimportant to know the height of this imaginary cod-um at any level than to know the fraction of the at-mosphere that lies above or below the level. This frac-tion is directly indicated when the C o B unit is employed, since I megadyne per square continuets in practically coultwise to a baroneer reading of 750 millimeters. In latitude 45 deg., which is the average presence of the stat at 105 meters above sea level in the same latitude. Hence, if we assume 104 meters above sea level as the plane of reference in barometry (and there are sound reasons for preferring it to sea level, the plane heretofore in use), the C G S unit may be considered a "C G S atmosphere," and the may be considered a "C G S atmosphere," and the fraction of a megafyne per square resultineir recorded at any initiation gives, for all practical purposes, the fraction of the atmosphere that lice above the point of observation. This unit has been named the bor, and its use in all meteorological observations has been recommended by several writers during the past year. Lastly, the Meteorological Gloss is now, in its kits and balloon work recording the direction of the wind in decrees of a circle, countiles from true morth. Seat-

in degrees of a circle, counting from true north. East is 90 deg , south 180 deg west 270 deg , and north 860 deg

It is proposed to establish a wireless telegraph sta-tion at the metaorological observatory on Mount Miration at the meteorological observatory on Mount Mir-dor in the Philippines, to give warning of typhome to vessels in the China Sea and points along the China coast. A similar ration will probably be eshablished later at Santo Dominge de Basco on the Jaland of Batan, for communicating information of the pre-sace of typhonous in that vicinity to the besiquaries of the Philippine Workler Bureau et Manglia.

### A 1916

ENGINEERING.

The same found of conail enceration at Panama during survey was \$463,855 onbie yards, of which professionally survey was \$463,855 onbie yards, of which professionally steam sherels. The amount taken out by the Panama during their occupancy of the canal was about \$4,865,850 onbie yards. Under American occupation, \$74,865,850 onbie yards. Under American occupation, \$66,850 onbie yards have been removed, leaving \$74,977,950 onbie yards have been removed, leaving \$74,977 of \$60,850 onbie yards have been removed, leaving \$74,977 of \$60,850 onbie yards of excavation to complete the canal.

B. St insertiable that the New York Central Rullmont's huge accession for fis new retailor, and the insertial retails and the second of the second of the ultimately covered with buildings. ### ELECTRICAL.

An electric elevator has been installed in the stairway which leads to the cupola of St. Peters Church in Rome, The elevator has a capacity for carrying ten persons. It bears an appropriate Latin inscription

A new combined electric and steam cooking range has recently been patented which is participally adapted for use in hotels. The range is divided into two compartments one of which is heated by nature. while the other is electrically heated. The latter is used for cooking, while the steam is used for hotel the contract of the cooking of the cooking the cooking the overal it is claimed that in this way a steady supply of heat is obtained very excommically

The Brooklyn Rapid Transit Company recently changed the form of brakes used on its care, adopting a "graduated release, quick-recharge" type In order to teach the motormen the best way of thing the new brakes, an air-brake catechian has been issued, and include the property of the continue has been given on the subject. In the mean time a text-book is being prepared showing in defaul how the brakes are arranged and how they should be

The Barila police department is provided with an actenite typereriting telegraph system. There are about 300 receiving stations throughout the city and suburbs. The sending instrument is provided with a keyboard, and when the keys are depressed they cause to message to the printed similaraneously at the sending station and at the receiving station. The object of the sending station and at the receiving station. The object of the sending station and at the receiving station. The object of the sending station and stations are sending stations as the sending station and sending stations are sending stations as the sending station and sending stations are sending stations as the sending station and sending stations are sending stations as the sending station and sending stations are sending stations as the sending station and sending stations are sending stations.

A sets of experiments was recently made at John Hopkins University to determine the dielectric strength of air. It was found that the point at which a brush discharge occurred in only alightly affected by the moisture in the air. From dry air to saturated air there is a drop in voltage of the discharge of less than 3 per cent. An increase of temperature from the freeding point to 40 deg. Cent. caused the lowering of voltage by about 5 per cent. Very erricourly affected the indication of the six affected the lowering of voltage by about 5 per cent. Very erricourly affected the lowering of voltage by about 5 per cent. Very erricourly affected the lowering of voltage by about 5 per cent. Very erricourly affected the louisation of the six of the content of the voltage by about 5 per cent.

"An investigation into the conductivity of electric visualizary was recently discussed in the Physikalische Zeits.hirft. It was found that hard rubber is greatly affected by light, particularly ultra violet rugs and that gutta percha is similarly affected though to to the same degree. Cheunical action appears to take place on the surface of the insulator, which produces a conductive coating. Sealing was and paraffine are also affected to a degree by light, but they are more subject to breakdown because of moliture. The conductivity of wood is to a far greater degree in least of the degree of the surface of the same rod of glass may have parts that differ materially in conductivity. The investigation also brought out the fact that the insulating qualities of all insulators decrease with an increase in ten

About a month age one of the Billoon storage battery care was placed on the Twenty-leighth Sirvet crosstown line as an experiment. The care has been in constant operation since and has required no niterations or repairs other than are common to the ordinary sirvet are it has proved remarkably economical in the consumption of power. Instead of conting two creat and is a mile as was in the sale of conting two creations are the sale of the continuity of the care that the c

A decidedly novel wireless telegraph detector has recently been invented by Prof Rosel of Turin It depends upon the torsional vibration of a fine iron kire, which is acted upon by magnetic lines of force that have a spiral direction. The wire is stretched close to two permanent magnets with like poles adjacent, and is also placed in the center of a coll through which current is passed that sets up a helical flux When the current through the coil is rapidly alternated the wire vibrates circularly; that is, it has a reciprocal rolary motion. At the outless of the reciprocal rolary motion At the outless of the reciprocal rolary motion. At the outless of the reciprocal rolary motion At the outless of the reciprocal rolary motion. Unward of twenty different systems of storm signais are at present used by the maritime countries of the world. A uniform international code is a desideratum, and the task of devising one was intrusted necratum, and the task of devising on was intrusted by the international Meteorological Committee to a small runmission which met in London last summer and agreed to recommend to the committee the adop-tion of a code proposed by Frof Moore chief of the United States Weather Bureau. This code substitutes a few simple combinations of the large conical symbols now used at a majority of the European ports for the storm flags bereforce used in the United fixtus and some other countries. Combinations of red and white lanterns are to be used at night to convey the same information as the day signals. The proposed code has not yet however been formally adopted by any government, pending the decision of the International Meteorological Committee which meets in Berlin next September Since the London meeting objections have been raised by the German authorities to the proposed night signals on the ground that they are not sufficiently distinctive and might be confused with other harbor lights. The Deutsche Seewarte at Hamburg is now experi ting with several systems of night signals and will lay the results of its investigations before the cour

## TIMING AN AUTOMOBILE RA

### AN AUTOMATIC INSTRUMENT THAT TAKES THE PLACE OF A STOPWATCH

Even the casual reader has no doubt observed that attomobile records are now expressed in hundredths of a second, whereas but a few months ago it was imsible to obtain any greater precision than fifths of a second, all of which indicates that the use of the

time honored split-second stop-watch has been outgrown in automobile races. When one stops to think about it it is really ab surd to try to time an automobile tra ing anywhere from a mile to two miles and over per minute with an indicator that crawls at a snail's pace around a dial but an inch and a quarter in diameter. In the recent race at Ormend, for instance where the mile record was reduced to 27.33 seconds by Harney Oldfield he was traveling nearly 200 feet each second, which is equivato the length of an ordinary New York block When automobiles were first city block used for racing purposes, they were timed by hand with stop watches. But, wherever an operator is depended upon to snap a stop watch, inaccuracies are apt to creep

in due to the fact that one person is quicker of per-ception than another. The timer must see the start of the tare, and as soon as this impression is received ust start his watch, then at the close of th the same operation must be undergone to stop the watch. The time required for this mental and physi-cal operation varies in different persons, and is known as the personal element. Not only does it vary with different persons but with the same person at differ officient persons but with the same person at other ent times depending upon his mental and physical condition. For this reason, even in the timing of foot races it was long ago found necessary to have three timers and to take the time of the middle watch, for the instruments of the three timers varied s much as three-fifths of a second Early in the history of automobile racing an e

was made to eliminate the personal element by hav-ing stop-watches snapped automatically by the cars themselves making or breaking an electrical contact when they crossed the starting and finishing tapes But, as we have just pointed out, even with the per element climinated, stop-watches are entirely too slow to record the time of so rapidly moving an object as a racing automobile. The experiment of using a chronograph was tried in several of the races last year but as this did not prove very satisfactory, Mr C H Warner of the Warner Instrument Com pany determined to make a special instrument par-ticularly adapted for this purpose This instrument vas first used at Atlanta last December, and has just been employed for timing the Ormond and Days races It works with the utmost precision, is en tirely automatic, and makes a printed record of the race, reading to hundredths of a second. The necessity of such great refinement of timing will be appre-ciated when one considers that the "Lightning Bens" during its record mile run was traveling at the rate of 2118 inches at every hundredth of a second her Warner's instrument consists of four type

wheels, one of which indicates hours the next min ntes the third seconds, and the last one-hundredths of a second. The wheels are operated after the man-per of an odometer instrument.

ner of an oometer instrument. Over the wheels runs a strip of pa per and above that a typewriter ribbon, and a record is made by a hammer actuated by an electro-magnet, which strikes the ribbon and paper against the type wheels. in the circuit of the magnet which operates the hammer is a relay switch controlled by an electro-maget in a circuit that is normally losed This closed circuit is connected with the starting and finish tapes, or with tapes at other points where it is desirable to record the The tape consists of a wire stretched across the course at a height of a few inches above the ground and this wire is connected, to a switch ingeniously constructed to be opened by the shock, rather

than an increase of tension when the wire is struck by the wheels of an automobile. When the switch opens the instruof an automobile. When the switch opens the instru-ment prints a record. The type wheels are frictionally mounted on a driving shaft, which is rotated by an electric motor. At the start of the race they are held stationary, and are not released until the starting wire to depressed, when they print zero and they begin their revolutions. The hundredths wheel makes a revolution entry two seconds. Obviously, the most important part of the instru-ment is the regulation of the electric motor which drives the type whoels it is impossible to construc-a motor so perfect or a storage battery that will discharge so uniformly, that there will be not the slight

To Bemodel the House of Representative

Because the acoustics of the House of Represents fives are so had that it is almost impossible for th ost impossible for the fives are so and that it is aimout impossible for the Speaker to hear a member of the House, unless that member has lungs of leather, plans have been drawn and all preparations made for a transformation of the lower house of Congress.

For many years now there has been trouble in the House both in the way of acoustics and with ven tion for such a large body, these two principal fea-tures have not been as they should be. The plans in contemplation will remedy these defects, and make the House one of the finest legislative chambers

One of the main ideas to be put into executi the reducing in size of the chamber. In this way it is thought that with smaller quarters, doing away with some of the galleries, and by narrowing the chamber, the acoustics will be all that could be desired. The ventilation will also be arranged to better advantage.

The plans as contemplated also bring the H Representatives in the same fashion as the British
liouse of Commons. In this manner benches and nouse or Commons. In this manner benches and small shelves will take the place of the desks and easy chairs now used by the members. The benches will resemble in appearance the chairs used in the-

aters. By taking away the 4 and easy chairs, it is thought that those members not interested in the debates or speeches will absent themselves from the chambe

The floor of the preber has an area of nearly 5,000 square feet. The floor plan of the proposed hall will only be about proposed hall will only be anou-6,900 square feet. The scating on-pacity of the new hall will be 430, although there are now less than 400 members of the Founs. Some of the lobbles and extyn

Some of the lobbles and extra rooms will be but out, and the re-duction in size of the hall will, at course, result in the reduction of the public galleries, whose seating

Owing to the possible conditions of the hall, with regard to, the hall with regard to, the hall with regard to, the constates and ventilation, many members while away their time by convening with each other in heat tensor or add to the consisting hy alamming their deads or kicking the conjuder, he portnends are being made now for a notesiare sequence of the contract of the contract

### A FINE LONG-SPAN MASONRY ARCH BRIDGE

BY OUR ENGLISH CORRESPONDENT

There has been erected on the new Bellegards-Chiesry electric railway in France a masonry bridge which in span and height ranks as the largest of its type in the country, and which possesses many interesting features The bridge is situated in the Department de l'Ain, and is in close prox

partient de l'Aix, and is in close proximity to the froutier of Switzerland in the easton of Geneva. This imposing structure was designed and erected un der the supervision of Monsirear Picard engineer in chief of the Bridge De partient to whose courtagy we are in debted for the accomplaying illustrations and details, and Monsteur borroad surveyor in chief of the depart

The new ratiread passes through the widest and most picturesses spots of the Jura Mountains and in its location follows the course of the Valerine stream a tributary to the Rhône This revised is troused twire first by means of the Bellegarde viaduct comprising seven spans sends of 60 feet in the clear by 150 feet in height, and secondly b a handsoom smaourry bridge the Moulin dee Pierres or Montangas which has a main pages of 85 feet 1%,

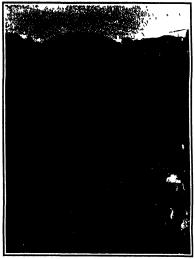

At the latter crossing the river flows through a deep rock zerog, the precipitous banks of which are over 170 feet in height. The rock was found to be of such accellent bearing quality that the engineer in chief decided to use the cliffs as the abutments of a sing from the affect has a fault of 184 feet 3, inch for the are at the intrades and of 177%, free at the actrades I he thickness of the masonry at the key stune is 4 feet 11 inches while the springing 8 feet 3% inches while the pringing 8 feet 3% inches while the springing 8 feet 3% inches while the pringing 8 feet 3% inches while the springing 8 feet 10% inches literassed with the sufficient of provide width for two foot paraments a railroad track of motor gage and a roadway paralleling the railroad track

### OUR MARYELOUS AUTOMOBILE INDUSTRY

If ever an industry has grown by leaps and bounds urely it is that of making motor cars. Even the bleycle in its painted days did not produce machines whose trial value for ten years could equal the truly cap mous sum of money represented by the automobile products made in the United States between 1895 and Mere figures tell but little For that re we have presented on the front page of this is graphic illustration, in which the wonderful strides made in the manufacture of motor cars are tellingly depicted These strides are all the more remarkable when it is considered that the industry had to weather the severe financial depression of 1808, a period which was one of the most critical in the recent financial history of this country

sidered merely from the standpoint of mor (onsidered merely from the standpoint of money, the automobile industry in this country presents a most wonderful spectacle. The total estimated value of automobiles to be manufactured in 1910 is \$237, 000 000 When the industry was born in this country, which was in 1895, the estimated value of the machines turned out was only \$157,000. In the brief space of turned out was only \$10,000 in the ories space where the best with a part of the form the form whose annual product is valued at millions. The intermediate stages between 1885 and 1910 show a growth which is stupendous. The stage from 1895 to 1895 marked an increase in the total value of nearly a mil lion dollars, the actual value of automobiles manufac-tured in 1899 being \$1,290,000 Still more remarkable is the development from 1899 to 1903, for the valua bile product in this country incre Learly sixteen fold in that time, the actual value of at comobiles produced in 1993 being \$16,000,000 Remark this as that increase undoubtedly was it was almost d by the interval from 1903 to 1907, for in 1907 \$105,000 000 worth of automobile may binery was many ato, one one worth of automosic man unsery was manu-factured From the year 1907 to 1910 a 100 per cent increase is to be expected. In other words, in these three years the more increase in value of the automo-bile industry will be greater than the total value of

the industry in the year 1907

An industry which has grown with such startling rapidity and which is valued at so princely a sum, naturally gives employment to an army of mechanics all of them skilled men handsomely paid. Thus w find that the mere wages paid for mechanics in 1910 will amount to about \$100 000,000 The chauffeurs who drive the many cars which were in use in 1910 will carn \$25,000 000 at the very least in 1910

The number of automobiles produced is nothing ort of staggering If all the cars of 1910 were place end to end, they would reach from New York to Pitta-burg, a distance of 438.76 miles. This output of 200,000 is three times greater than that of 1907, considered is three times greater than that or 1907, commonweal from this linear standpoint, for the automobiles of 1807, had they been placed end to end, would have extended from New York to Harriaburg, a distance of 18105 miles Compared with this, the 13.333 extended from New York to harringing, a distance of 19195 miles Compared with this, the 18.33 automobiles manufactured in 1803 seem exceedingly small, although as a matter of fact the machines for that year, had they been placed end to end, would have extended from New York to New Brunswick, N. J. a distance of 29.25 miles. Even this, small as it seems in comparison with the gigantic production of 1910, is high when we consider that between 1896 and 1899 the 670 automobiles produced in this country would have extended only from New York to Jersey City, a dispace of 14 by the stance of 146 miles.

Had all the automobiles made in 1910 been converted itan as the automobiles made in 1810 been converted futo a single huge makine, the result would be, as our frontjuge fillustration shows, a car which would be longer than the steamship "St. Paul," measuring be longer than the steamably "St. Paul," measuring life feet from stem to stem: Preven the output of 1899 had it been thus converted into a single machine, would have been longer than the "St. Paul". The machines of 1803 similarly considered would be been three-quarters as long "The output of 1986 his per output of 1986

Naturally an industry of such Titanic proportions must be capitalised at millions. On the whole, it is safe to say that the actual capitalisation of the automobile manufacturers is about \$250,000,000 The out now there are over 150,000 automobiles in use throughout the country The actual number of employes in the industry is 125,000 in motor-car factories, with employée in paris factories reaching not less than 40,000, a total of 185,000

Hand in hand with this increase in money w Hand in hand with this increase in money value, we find improvements in manufacturing processes. Five years ago, where a man would have paid from \$2,000 for a touring ear, or \$500 to \$1,200 for a runshout he scarcely expected to get much in the way ransions as survey expected to get much in the subserance of un-of durability, or if he did, in the subserance of un-sophisticated anticipation, he was almost sure to be disappointed before he had used the ear many days. When we recorded the automobile runs of those days in these columns, we unually had to recite a series of troubles of various sorts, theny with tires carbareters, ignition devices, as well as breakages and imperfect functioning of valve mechanisms, shafts, gears, chains,

steering knuckles, driving axles, and other vital parts. Contrasting this condition with the results of the Oliddon Tour of 1909, we find that thirty cars to part in that run and finished an arduous trip of 2,640 part in that run and finished an arduous trip of 3,849 miles in 15 days, at an average speed of twenty miles an hour during the daylight running periods, without making a single involuntary stop. That tells the tale of the wonderful technical improvements which have en effected in the brief space of a few years rarely indeed that repairs are made during runs n adays. Occasionally a brake, a carbureter, an ignition system, may have to be adjusted, or a tire may blow

ranem, may have to be adjusted, or a tire may blow out, but the cars operate smoothly and trustworthly. The introduction of special grades of steel, alumin ium, vanadium, and babbit, all of them endowed with definite physical properties recollect. nite physical properties peculiarly suited to the nirements of automobile manufacture, have won fully improved the quality of the motor steel and chrome-nickel steel are now used in crank shafts, transmission shafts, driving axies, driving and differential steering gears, steering knuckles, and similar paris, manganese-bronse, phosphor-bronze, an various aluminium alloys find their places in crank cases goar boxes, steering goar housings, and parts de-manding great stiffness combined with light weight. The automobile industry is very largely responsible

discovery of the physical properties of chrome steel and vanadium-chrome steel under different modes of heat treatment and for the introduction of special tool steels required to work them, and has th indirectly benefited the metallurgical industry of this As a result of the emp steels in the sliding gear sets, by way of illustration, it is now possible to transmit the 40 and 60 horse-power of the modern touring car with smaller and lighter gear sets than were used in cars of 12, 15 and 20 horse-power five years ago, and that with much greater certainty against breakage and the practical elimination of the mangling of the ends of the teeth meshing and of wear due to contact under load. All this improvement in quality, plus infinitely more grace in general lines and in comfort to the passengers, is in general lines and in comfort to the passengers, is offered to the buyer almost at no advance in cost over the impainty, uncomfortable, and poorly-subject care a great proportion of the automobiles manufactured in 190 will be low prized care in The car that could be lought a low years ago if The car that could be lought a low years ago by the man of moderate income required close attention. Automobiling at time was unquestionably a diversion for the rich. Novodays a man of moderate means can purchase thus et acr at an expense that is well within the bounds of reason

In the early days of the automobile industry, the manufacturer was under the necessity of making all his parts, to-day the factories actually making even 75 per cent of the parts that they use are in small pro-portion to the number of producers It is to these changes that the excellence of the menium priced automobile is largely due. There was a time when an as-sembled car was undoubtedly open to suspicion, for however desirous a maker of its parts might be good work, he had neither the knowledge nor the facili ties that would make it possible These annie companies now possesses enormous plants. Their designers and equipment are the best obtainable and their products embody the latest and best in practice, workmanship, and material Assemblers now have at their command parts of a high degree of excellence, and (an buy them at prices fer below those charged for the weak and faulty product of former years.

When a manufacturer turns out twenty thousand ars a year it is not only justifiable but necessary for him to invest very considerable sums in special ma chinery of all kinds that for a smaller output would be inadvisable. One manufacturer has spent \$40,000 or manusance one manuscurrer has specify \$40,000 or dies to produce a rear asks housing, on a production of one thousand cars, the charge against each for this would be \$40 With an output of twenty thousand cars, however, the charge of \$2 against each is little enough for the purchaser to pay for so excellent

A recent development that illustrates the endeavor A recent development that interfaces the endestor to reduce manufacturing costs is the establishment by some of the leading producers of assembling shops at the large centers. To these are shipped parts in suffi-cient quantity to build the cars required for that locleat quantity to build the cars required nor max to-cality, and as there is no equipment of machine tools, the expense is slight. The freight rate on unassem-bled parts is much lower than on complete cars, and the saving effected in time and convenience as well as

the saving effected in time and convenience as well a in money makes the system a satisfactory one. Vast as the automobile industry is, buge as is the value of its output, it must not be supposed that the ed that the value of its output, it must not be supposed that the protest are linglishmate. It is safe to say that the present-day manufacture of medium-priod cars makes no more than a legitimate profit. One of the largest producers stated recently that his predit on a \$1,000 car is less than \$100, surely not excessive when one creations this common investment in makes and appart, his really vast equipment, of, makelue tools, and his labor expense.

sign a car to sell at \$4,000, but that the greatest sits necessary what the selling price is to be less the \$1,000. Perhaps that may account for some of the

\$1,000 Parhaps that may account for some of the decedingly clarer designing in the lever-priod cars.
The scene of the industry has shifted in the years
The scene of the industry has shifted in the years
from 138% to 1310. Much of the early experimenting
in motor cars and early manufacturing was done in
Bufflio, Tarrytown, Marica, N. J. Bridgeport and
Hartford, Chim, Philadelphia, Pa., and other Enters
States. All processors Middigan index all the States in motor-car manufacturing, for that State last year made 112,000 of the total production of cars for 1909. Four other States adjoining it will produce 75,075 ma-chines at least. The Middle West may therefore be said to be the real home of the auton obile industry at the present time It controls not only the car-mak ing industry, but the making of tires, parts, and soces sories as well, a condition which is primarily due to the industrial enterprise of the smaller communities of the Middle West, who have given land and in every way furthered the making of automobiles. It must also naidered that the makers of automatic machiners be considered that the makers of automatic machinery are very largely situated in the West, for which rea-son the better class of skilled labor is there to be found Jastly, the shifting of the industry from the East to the Middle West has been caused in part at least by the fact that the raw material is there put through its first and second processes, as in the case of

unrough 14 mrst and second processes, as in the case or rubber, steel, leather, wood, brass, and the like That the Middie West is undoubtedly benefited by the indux of automobile manufacturers can be shown by the wonderful increase in the population of seme of has doubled and trebled the populations of such of the smaller towns. The influx of 2,000 to 5,000 families has doubled and trebled the populations of such ofties as Flint Micn, and Newcastle, Ind, and greatly enand Newmatis, Ind., and greatly enhanced the value of real estate. Towns which were practically in the control of the control

Cost of Various Methods of Illumination.

The Frankfurter Zeliung publishes the following remarkably complete table of the cost of various methods of illumination

Cost of 100 normal candle hours.

### PFITENER'S MODOPLANE.

To the Editor of the SCHATTIFUC AMERICAN
I have just read with much interest an article in
your issue of February 12th under the caption "A Novel American Aeroplane."

The monoplane has always appealed to me as being more consistent with the law of nature, and therefore more susceptible of continued improvement and event-ual perfection, than the biplane. The double or triple planes strike me as being contrary to the examples set us by Nature, the extra planes being a superfluity of which Dame Nature is rarely, if ever, guilty It would be an incongruity for a bird to be supplied with more than one pair of wings, unless the duplex or triplex wings were accompanied by a Siamese-twin or riphes wings were accompanied by a Siamese-twin or triplicate body. As long as there is but one body and one source of motive and controlling power, a single pair of supporting planes would appear to be all that is necessary if the planes are sufficiently extended to is absonanty it the planes are summing extended to support the body at the speed normal to the bird. Ad-ditional planes do not sufficiently compensate by their increased buoyancy for the increased weight, unwieldiness, and instability I therefore pin my faith to the monoplane as likely to afford an additional illustration of the truth of the Darwinian theory of "the survival

Mr Pfitzner's design, according to my ideas, comes earer to the ideal heavier-than-air flying machine than anything that has heretofore been brought to my attertion. I will be greatly mistaken, and disappointed a

well, if we do not hear from his machine ere long as successfully rivaling even the best of the biplanes. But even Mr. Pfitzner's novel design is susceptible of improvement I cannot help wondering why nother he, nor any other aviator as far as I have been able to ne, nor any other aviator as far as I have been able to observe, has adopted what I consider to be a very essential element of stability invariably to be found in the make-up of the denizes of the air. I mean the invariable disposition of the weight of the body to the supporting planes. Mr Pfixmer seems to have entirely ignored this principle, like all other aviators, by placing his engine and driver's seat above or on a level the supporting plan

Nature, on the contrary suspends nearly the entire eight of the bird below the level of the wings or planes, evidently for the express purpose of securing stability. During flight, or particularly while soaring, the extended wings of the bussard (to adopt a familiar uple) are hold in a plane slightly above the point neir juncture with the body, while at the same time head is lowered and extended forward, so as to bring it down to or beneath the plane of the wings While the bird is sating in a calm atmosphere, the legs and feet are drawn up toward the body, but let a sudden gust of wind strike under one wing and tend a studen gust or wind strike under one wing and result to displace the center of gravity, the logs are at once extended in order to lower the center of gravity, and equilibrium is at once restored. This seems to me to be a wise provision of Nature worthy of imitation as

far as is practicable by the aviator

With the engine, and naphtha and water tanks, as
well as the seat of the aviator, rigidly suspended as fur as conveniently possible below the planes, the weight acts like a pendulum, the plumb-bob of the weagns acts like a pendulum, the plumb-bob of the mason, or the ballast of a ship, its constant tendency being to restore the equilibrium of the planes the mo-ment the disturbing force is removed. And in making a change of direction, if the radius of the curve is a change of direction, it the radius of the three is abrupt, the tendency of the outer plane to rise on account of its increased speed as compared to the re-tarded speed of the luner plane will be measurably counteracted. With the weights so disposed, the ex-tended planes will act like a parachute, and in case of tested planes will not me parameter and in case the sudden breakdown of the engine or propeller would, in conjunction with the usual downward glide of the machine, enable the aviator to alight in an open space "right side up," without damage to either him-

space right sear up, self or his aeroplane were hir Pfinner to raise his planes to the tops of the vertical posts, and lower the engine, tanks, and exet to a level with the axies of the carriage, he would find that much less skill would be required to preserve find that much less anni would be required by pro-peller shaft should remain on a level with the planes, but if lowered just far enough to enable the blades to clear the ground, I apprachend he would be able to make a quicker start. The tendency to drive the plane upward would assist it in leaving the ground, and, once afeat, that tendency, if persisted in, could readily be counteracted by the proper use of the for-ward horisontal rudder, without perceptibly impeding

ward horizontal rudder, without percepting impression the speed of the firer.

I would ruggest another scheme for the rudders. Let them be connected together, so they words sowe in union. When the horizontal rudder is diversed and depressed in order to rise or descend, it would not not not really the percentification of the rudders of

right or left in order to alter the course, it would influence on the elevation of the machine.

I possess but a superrical knowledge of aviation, and I have no means for investigation or experiment, but I have been intensely interested in the science ever since the Wrights' experiments were first made public. The above thoughts came to me as I read and public. The above thoughts came to me as I read and public and the description of Mr Phinner's novel device I make bold to offer them to you for publication if you deem them worthy of being embalm ed in print. Norfolk, Va C E McChure

### THAT NUMBER PURSUE,

To the Editor of the Scheniffo American
If your correspondent in the issue of January 22nd
will study the following figures, be will plainly see
that it is not impossible to get 35 sets of 3 out of 1—15,
so that no two numbers will be in the same set more

| 1 2 3   | 2 410          | 3 611        | 4-9-12     | 6 913      |
|---------|----------------|--------------|------------|------------|
| 1 4 €   | 2- 5-11        | 2 7-12       | 4-13-14    | 6-10-14    |
|         | 2 612          |              |            | 7 8 5      |
|         | 2 713          |              |            | 71114      |
| 1-12-14 | 2- 9-15        | 4 7 15       | 5-14-15    | 10-11-18   |

presented by him in the same issue, he will discover that the numbers 4 and 6 are twice paired, leaving only 29 sets without duplicates

### REBUILDING THE "IDANO" AND "WINISHIPPI "

To the Editor of the Scientific AMERICAN As one of your readers, I have been following with interest the proposals put forward by various genti-men regarding the reconstructing and rearming of the different types of pre-dreadnought battleships in

In the March 5th number of your paper you published a letter from Mr W W Bass concerning a proposed rebuilding of the battleships "Idaho" and 'Mississippi' soss to make them nearly equal to the Louistana" class. One of the objectious put for

clas ss. One of the objectious put ward was the impossibility of establishing a 10 inch gun in a turret built for two 3-inch. Why not avoid this difficulty by leaving the eight 8 inch guns stready this difficulty by reaving the sign sized gains arrows; mounted where they are and then to increase as much as possible the 7-inch battery below? This would make these ships even more similar to the "Louisiana".

I do not believe that the cutting in two of a battle ship would entail very great difficulties as a few years ago a White Star liner was cut in two and a new bow built on the original having been destroyed by an accident. A torpedo-boat destroyer of the Brit ish mayy also was rebuilt in this manner

But if it was deemed too expensive to build this section as proposed, would it not be feasible to sacri fire a few 7 luch guns and re-engine the ships turbines of greater power thus attaining the extra knot and a half necessary to bring them up to the knot and a half necessary to bring them up to the "Louisiana's" speed standard without the cost, time. and labor of totally rebuilding them?

New York, March 21, 1910

(The "Ideho" and "Mississippi" are so much shorter [The "Idaho" and "Mississippi" are so much shortor than the "Connecticut that there would be no room for the mounting of additional 7-inch guns It would be useless to install turbines in these ships without increasing their length and the cost of both chang increasing their length and the cost of both changes would not be warranted by the advantages of addi-tional 7 inch guns and the greater speed secured thereby. The deficiencies in these ships are due to the artion of Congress in limiting the displacement to 13 000 tons -- Ep.1

### Booth of Alexander Assault.

Prof Alexander Agassis died on the steamer "Adri-atic" on March 29th, while on his way to New York Hardly less famous as a scientist than his father, he was noted not only as a biologist but as a mining engineer financier, teacher and man of the world his life he combined the activities of president of Calumet and Hecia Mining Company and director of the Museum of Comparative Zoology at Harvard, founded by his father Prof Agamsis was born in founded by his father Prof Agassis was born in Neuchattel in 1855 and did not come to this country until he was fifteen. His early education was re-ceived in Europe, although he was graduated from Exprard with the class of 1855. He started out in life as a civil engineer, and did much valuable work as senigrant on the Atlantic Geodetic Coast Survey His work in that field naturally drew his attention to the natural sciences. He began to collect fishes for his father, and thus was induced to follow in his father's footsteps. After that his activities were al-most equally divided between scology and mining A study of the copper mines of Peru and Chili led

most equally divined between soology and mining
A study of the copper mines of heru and chill led
him to a survey of Lake Titicacs, and siso to collect
Peruvian relies, which are now lodged in the Peabody Museum at Harvard Five years of his life, from
1878 to 1881 he apont in deep-sea dredging. It is biological survey of the waters of the Gulf of Mexico and

the Caribbean Sea is still regarded as classic His exploitation of the Calumet and Hecla mines to his profit secured the means to gratify his fat ambition, the erection of the great Harvard Mu of Comparative Zoology

He made by his persistence and ability in argument the development of the Lake Superior copper territory on Kewsenaw Point (and now later trace to the mainland) a certainty

### Beath of Hermann Mordebeck.

Oberstleutnant s D Hermann Mordebak died re cently With him there has passed away one of the most ardent advocates of acro-navigation. Thanks to his efforts the Deutsche Verein fuer Luftschiffahrt is ed in its programme meteorological measurements As a young lieutenant, Moodebeck became a member of the Deutsche Verein zur Fordorung der Luftschiffahrt. As a captain he founded in Strasburg the Oberrheinische Verein fuer Luftschiffahrt, and pub the lished its official organ, illustritte Arrosautische Mitchiunnen, now the official organ of all the General organic and the official organ of all the General organic arronautic sorteties. In 1907 Mondelsche was premoted to Observationant A year later he returned from active army service in order to devote his entire time to account the was a mumber of the latera-tional Commission for Scientific Aeronautics and a carrer member of the International Commission of Aeronautic Maps. It was only recently that he founded as a sero Luttfottenveren fuer Bertin und Branden burg. lished its official organ Illustricta Aeronautische Mit-

### Beath of Galen Clark.

Galen Clark, who died in Caklafd Cal, on March 24th, had been known for the last half century to almost every tourist who has visited the Yosem Valley While on a hunting trip in 1857, he discover the great redwood grove at Maripesa. Seen after that Clark devoted much of his time to exploring the upper heights of the Sierra Nevada Mountains, and made known to the world much of the beauties wonders of the big tree groves and of Yesemite

### The furrent Supplement.

In the current Supplement, No. 1788, Mr. P. M'N. Bennie reviews the recent work which has been in the electrical reduction of iron and steel There is much confusion with regard to dyestuffs and the colors which they impart to the textile fabric, and colors which they impart to the textile fabric, and this confusion Prof Otto N Witt seeks to remove Sonse very interesting movilles in toys are described and illustrated Lieut, John C. Solely enhanced to an article on the South Pole will be found mon tioned the various schemes which have recently been put furth to reach the South Pole Prof George E Haiss admirable consideration of solar vortices and magnetic fields, in which be reviewed her become and magnetic fields, in which be reviewed her second study of the sun is concluded Halley's comet is now visible to the naked eye just before dawn in the oasiern sky, for which reason Mr George F Chambers's rough article on this interesting wanderer is published with piculiar timeliness. One of the most important articles in the Supplement is Mr Aston's account of the recent Olympia acro exhibition by far the biggost of its kind which has ever been held in

According to the Engineering Record Improved According to the Engineering Record improved belier performance has been stationed at the Anderson station of the Indiana Union Truction Company by preventing the leakage of air from the sabults around the onds of the chain graties into the flows. This is accomplished by first faling a 4 find outsteadary pips across the formace & inches from the rear of the granulated by first flowing and the control of the granulation. There has some of about 10 inches between the center of the pipe and the rear first perfect perfec the upp of the grant There is a span or about 10 inches between the center of the pipe and the reaffer box wall, which is covered with a course of first-brick. This short provents the passage of air, while the pipe holds back uncobaumed coal until it has been burned into ask, which the grant can earry back under the pipe in one of 1 inch diameter running from one end nearly to the other Cold water is admitted through the small the angle flower and done have the contract of the small pipe and flows back through the large one, the rate of flow being adjusted so that its final temperature is just under the boiling point. The water is discharged in a way that permits its dition to be inspected, into a header delivering it to

### OUR SEACOAST DEFENSES

BY CAPT. H. E. CLOKE, U. S. ARMY

When the Constitution of the United States was framed creating a republicul ferm of government provisions were made for the creatin of military and naval force and for the exist n f

Owing to the fact that access to our cest fertifica-tions has in years past been prohibited to the etit-zens of this country, it is not surprising how few mea-understand the method of fring a high powered gun or a modern mortar For this reason the following de

duty for in case of imminent attack the men sleep at the guns. The battle commander then notifies the fire commanders by telephone of the approach of the fact. The fact would probably be picked up at twa or twelve thousand yards. At this range all the heavy

It set en fo i prote that it stype filesquaring give regid fregen. It can set ally be fired more a lilitet it; I begine en rel 100 protofills at 6000 yards range several lisses Positions of detachment at command "Tond" for 0-inch disappearing rifle.

rapidly The range finder is the eye of the system white the teles hone and telestograph are its nerr The hitting power of a batt ey absolutely depends upon its range finder A range-finding room. (B' station)

No better service could be send red to the country and there is no service that should a peal more to the particular of our State troops than this and particularly the troops of those State which border the coast to I defended Our organized State militia and the various labor organizations should be at tracted to the subject of coast defense for the rosson that men in such organizations are unable to leave that me in anh organizations are unable to leave their families and business interests and entitle their families and business interests and entitle general strike in time of war. If they were organized the as a distinctive tores for the protection of their homes against invasion the defensive force of the little and conting would be in reased by a body on n cf a high ord r cf patristism and intiliges we What one contingiates the cost our costs difference cirtainly do appear to be an expinate investment ber occample a Little gun complet cents such as 1416 000 and as their are about our bundred of those, was mounted in our coset forts the cost of the

guns mounted in our coast forts the cost of the 12 inch guns alone amounts to \$17 000 000. On the other hand we must remember that this sum does not equal the cost of two Disanoughts it costs about \$600 every time one of these guns is fired with an armor piering explosive shell but one of these shells if directed at the proper point on a modern battleship will inflict hundreds of thousands of dollars worth of will inflick hundred of thousands of dollars worth of damage. Although one submant in mine charged with a hundred pounds of nitre giverine costs about \$700 is may it regioned understate a battleably send many millions of dollars to the hotions of the sax On the oth 1 hand the life of the 12 land pure without refilling to only about 250 pounds that is to say far ing one shot every thirty seconds the time of file of a 12 inh 1 life ) the pure becomes unclose after a two hour edgagement.

scription illustrated by the different drawings is given let us consider the enemys fleet to have been sighted on the horizon and headed under full steam in n tormation for the entrance of a harbor attack is being made during a late hour of the night On the discovery of the leading ship by the powerful

### Scientific American

I accordary grations, the observers the instruments read the satisficth gies at the base ends. These angles immediately plotted on the plot are immediately plotted on the plot sing board, and the position of the tar gut with reference to the centre of the gun is determined. At the expiration of 15 seconds, the bell again rings, and the target is again plotted. The course of the ship is then accurately deter-mined and, by means of a mechanical mined and, by means of a mechanical device on the gun arm, the amount the target has changed in azimuth, due to its speed, is determined. The last range read is now set on a device called the range board. This device is prac-tically a grapplic adding and subtracting machine. The corrections above remachine The corrections above re-ferred to for atmosphere wind, tide sto are here applied, and the resultant correction (a reference number) is set off on the gun arm of the plotting board, and corrected ranges are now sent to the gun by telephone or telauto graph This range is called the cor-rected predicted range to the target. It is predicted for an interval of 15 or 30 seconds ahead It is now plugged 30 seconds ahead It is now plugged in on the time range relation board which is in full view of the range keeper at the gun The range keeper thesepe the range disk continually set at the corrected range (as observed on the time range rolation board) such that the gun can be fired at any time The deflection correction is obtain ed bs The deflection correction is obtained by the use of a device called the deflection board. This as in the case of the range board is an adding and subtract ing machine which determines the flection to be set on the sight due to wind drift and speed of target. The drift is determined by ballistic cal rulations, and the curve is constructed on a metal leaf on the brard. The velocity of the wind is determined at the meteorological station by means of an anemometer and is received at the tting room by means of an electrical device called the peroscope shown in

Droups of these deadly reapons of destruction are planted across channels to keep the sceny out. To are startless to freeding super sout are extendly controlled in an extensive conflict on the first first report of the controlled and the startless of the startl

### OUR CIVIL DAY

### ITS ARRIVAL ON AND PROGRESS AROUND THE EARTH BY DANIEL ARTHUR

A few generations before our era the "whole known world was only some 2; million square miles in ex-tent instead of nearly 200 millions as we now know. That great observer and geographer Fratosthenes made a noble mitempt about 225 H. C. to draw a map of the "World". It even used lines which looked wave likeparallels of latitude and circles of longitude. These lines were largely based on the speed records of much me and hence were not very accurate There were no such refinements on his maps as international date lines or time zones. His general outline of the 'whole world" was about 90 south It was all above our equator, and extended only about a quarter of the way around the earth The month of the Ganges was farthest east and what h now belond was farthest west. The Cas-plan Sea was thought to be an arm of the Northplan Na was thought to as an arm of the Nord-era (Kenn, while the lower and of the Red Sea was shoult the southern Hmit. Knowledge of the rest, of the world grow very slowly then, as was shown by the fact that the great Strabo dre a map of the "World two hundred years later (about 25 B C) and made no material extension of its lines. He pushed Great Britain and Ireland farther west and made some radical changes on the northern edge of the Mediterranean, but other

the northern edgs of the Mediterraneon, but other whee those two maps of two hundred years agard are practically the same. There is very little doubt, however, that sixthoo though the world to be round, before he died. Hence, the encessity for a date: Hen was fit even at this early date. With the spherical carth these was questing through its hundreds of years of recisioner some radical observers starred it spinning on its axis so to speak. They were bold men, but they proved their case. This brought the date line as a nece Insir rease. This brought the date line as a necessity closer to us. It would almost seem that with a flat disk world" converted into a stationary globe, and hier into a rotating globe the date line idea should have suggested itself at once. Not so, however, for it appears that when Magellan crossed the Allainte from the east be Magnism trossed the Atlantic from the east he passed around Sunth America crossed the Pathi, discovered the Philippin Islands, and went home around the lower end of Africa thus completing a trip around the world. This trip was made less than four hundred years ago, yet when the explorers arrived at their home country they were astonished to find that they carried a date on board their ships which vas a day earlier han the home date It was soon found that no mistakes were made on the log books as to the fitne records and that the home calendar was certainly correct. The explanation of this seem

to a set of questions sent by the writer. The man, together with the questions and the answers, will be found on a recent Paulin thant issued by the Navy Department To describe the line, commencing at the northern end, it will be seen that the first deflection of practice is to the cast, to give the tip of Siberia the same date as the rost of the Russian om-

Theoretical date line # Date line when Alaska took date of Busela and Philippines took d to of Pipelin | 5 Date line after purchase of Alaska and Philippines took Asiatic date | 4 Prosent International date line

### Fig 1 -The evolution of the international date line

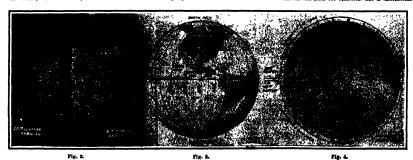

pir Then after the line passes through Bering Strait it beers to the west, crossing the true line of 180 deg and far enough beyond it to take in all of the Alcutian Islands to the American date, after which it turns back to 180 deg, where it stays until it cros lurns back to law deg, where it stays until it crossess the cquater a few degrees, at which point it again deflects eastwardly to give the Tonga lalands the date of Australia The line then returns to the 180th meridian and continues on that line to the south

The foregoing is the 'international date line' of

1948, to bring those islands into accord with the date of the countries east of the Cape of Good Hope. When Alaska was accrited by the United States, the data line was transferred west of that territory or late Bering Stratt. These two radical changes made being of practice look more like the third diagram in Fig. 1 Reter to Fig. 3, which is intended to show the entrance of time on our globe. The picture illustrates a mechanical dislevery of our civil day, month, year, or century by means of an equa torial tage. Let us assume that the earth is stationary and that this tape enters and departs under the date-line reliers as shown. If the tape had a speed of about 1,640 miles per hour and was properly marked in hours, days, months, etc., it properly marked in hours, days, months, etc., it would show just how our civil day enters the earth would show just how our civil day enters the earth and progressee around it with a constant motion. The illustration shows the front and of the twen tiche century as having completed is hours of the first day on earth, leaving only 8 hours of the minecessith century to gittle coward the line and off, to no one knows where The front end of the control of the contro minute and January 2nd growing broader at the same velocity. This of course is assuming that time is entering normally and not by the arbitime is entering normally and not by the arbitrary intermitient stops that we will call the twenty four way stations of our civil day. This latter system is in successful operation in the United States and two or three other leading nations, China being one of the more recent converts to the hourly sone system.

veris to the hourly some system. Fig 3 shows the earth with the hourly time belts or somes outlined from pole to pole. The line drawn are 15 deg, apart and represent the boundary lines of those zones and spit their centers. Fig 4 is the same outgable as viewed from the north star In the lillustrations the United States are continued in

approximately the correct location, so as to show the theoretical boundary lines of the hourly zones as amplied to that country love to the hoursy somes as applied to that country Now in these two illustra-tions let us assume that the system has been adopted in all parts of the world Commencing with the prime meridian at Greenwich as the center of a some bounded by lines 71/2 deg east and 71/2 deg west, the comple-tion of such a set of lines would give us just what is drawn and what our United States are actually using in theory To illustrate mechanically the delivery of time on this plan, our equatorial tape is intermittent

How the twentieth century was makered in -a mechanical parallel. OUR CIVIL DAY-ITS ARRIVAL ON AND PROGRESS ABOUND THE EARTH.

ing impossibility was soon forthcoming, and our date line was been in fact

As no one wanted the line near his home or coun As no one wanted the time near his nume or country, it was put in the most out of-the-way place possible, where it still stays. The 180th degree meridian is in theory where each new civil day is born, but in mractice it has never been strictly adhered to. Fig. 1 practice it has never been strictly adhered to Fig 1 diagram 4, shows its location with the deflections of practice as they new exist on the official map at Washington. This map was made by the Hydrographic Office of the United States to illustrate its replies

practice at the present time, but in former generations the deflections were considerably greater, as for complet the one shown in the second diagram of Fig. 1 in this date line Alanka was taken into the day of Russia, to which supply all formarity belonged. The line there took a westerly away of throusands of miles to the contract of the contract to take the Philippine Islands under the date as written in Spain This latter wide deflection was afterward turned back or corrected by the action of the Covernor General of the Philippines when he decreed that Documber Sizt, 1844, be recknowd as January ist,

in its action, that is to say, it jumps 1,040 miles and then stands still for an hour, which means that on the twenty-fourth jump on any day of a given name, that (Continued on page 207)

### NOVEL AUTOMOBILE PUMP

Pictured in the accompanying engraving is an inreceived in the accompanying engraving is an in-teresting form of pump, that may be used for inflat-ing an automobile tire. The device is arranged to be operated by the automobile itself. It consists of a base A, on which is mounted a jack used to rates an operated by the automobile itself. It consists of a base A, on which is mounted a jack used to raise an automobile axie so that the wheel will clear the aground. The base A carries a since B, which is de-signed to assist in positioning the automobile wheel with respect to the pumping device before the jack is operated to raise if The pump is indicated at O, and is mounted to rock on a bott J. The pump ton B in connected to the automobile wheel by a device above alonging in the consecutional view (Fig.

MOVEL AUTOMOBILE PUMP

A slotted plate F is provided with teeth adapted 3) A stotted plate F is provided with rech asabted to engage similar tech on a slotted plate G The plate G is provided with a crank pin, to which the platon rod E is connected The plate G is provided with an apertured extension, adapted to fit over the axic of the automobile wheel The plate F is attached axle of the automobile wheel The plate F is attached to one of the spokes of the wheel by means of a hook H while a pair of hinged braces J are used to connect it with two more spokes of the wheel In this way a rigid connection with the wheel is secured By loowening the thumb nut on the book H the plate F may be moved up or down on plate G so as to adjust the parts to wheels of different sizes. The distance from the crank pin to the center of the wheel however, is fixed In use the automobile engine is operated to rotate the wheel, and this action carries the piston up and down in a cylinder, the latter rocking back and forth to accommodate itself to the lateral throw of the crank pin A flexible tube connect the pump with the tire that is to be inflated. By this arrangement a tire may be inflated very rapidly, and the inflation carried to a further degree than is pos-sible by the manual operation. By using a speed at tachment of any of the well-known types, the burst ing of tires due to excessive pressure n This inventor of this automobile nump is Dr Richard A. Goeth of San Antonio, Texas.

### COLLECTION BOX FOR MAIL CHUTES.

Collection boxes at the termini of mail chutes are frequently filled to such an extent before the mail is removed that when the collection is made the mail es out of the box on opening the box door as tumbles out of the box on opening the box door and falls to the floor in spite of every precaution taken by the collector To better this bethersome condition a box has recently been devided which is provided with a platform having foldable side walls that permit the platform to wing downward when the door of the box is opened and serve to prevent the null matter from falling from the lox. The countraction of this

COLLECTION BOX FOR MAIL CRUTES,

box is clearly shown in the accompanying engraving Fig. 1 shows the box door open with the platform A swung down horizontally The platform is provided with two side wall plates B rigidly secured thereto with two area wan places B riginly secured increase and a series of sector shaped plates C. Near the for-ward edge of each of the plates B and C is a groove D adapted to receive a pin mounted on the adjacent plate, while at the opposite ends the plates of each side wall are mounted on a common hinge pin This permits the side walls to close up somewhat after the manner of a fan to the position indicated in Fig 2 The innermost sector C is provided with a lug E, which the outward swing of the platform A To prevent the letters from dropping between the sector plates the top of the box is provided with two guards F which extend below the upper edge of the plates. In use when the platform is lowered the letters in the box will turnble out through the door opening and will be caught by the platform and side walls. The inventor of this collection box for mail chutes is Mr R E Edwards. care of T J Kelly, 29 South Eleventh Street, Lincoln,

A REW SOUNDING BOARD FOR FIANCE.

The woul of a plane is its sounding board. The mounding board is composed of wood carefully select That and carefully seasoned, so that it will remain constant in quality for the many years during which a plane It is arched or crowned against the pres is used. sure of the strings so that the strings and the s ing board may vibrate in harmony As the plane ages the sounding board flattens. In an upright plane this flattening is accompanied by 'buckling back" or tracking The result is that hard metallic so-tailed "tin panny, tone so characteristic of old planes It is obvious that if some means were provided for permanently arching the sounding board against the pressure of the strings, the plane ought maintain its tone for years without any tendency

of the sounding board to sag

The attempt has been made frequently. Some success has been attained in grand planes by the em ployment of tension rods radiating from a center hub to the sounding board rim, but so far as we are aware no one has ever successfully equipped the upright plane with a sounding board so constructed that it would not lose its arch in time. A sounding board type which has been successfully applied to an upright plane has recently been inver B Long of Los Angeles Cal and is lilus

trated in the accompanying engraving
What Mr Long has done can best be understood

TRUSION DEVICE FOR PLANO SOUNDING BOARDS

when we consider the true function of the sounding board of a piano. The sounding board serves to sus-tain and amplify the tone produced when a hammer strikes the strings. Mr Long has increased the tone sustaining and amplifying quality of the sounding board by flexible reinforcing means interposed between the sounding board and the sounding board frame, thus equalizing the flexibility of the sounding board and at the same time maintaining its relation to the sounding board frame, so that the greatest pos-able vitality of the sounding board is insured. From the accompanying illustration, which shows the front of an upright plane with Mr Long's sounding board position, it will be observed that the edge of the ln po posts interposed between the edge of the sounding state of the sou beneating effect, the pressure post serves the additional pur pose of maintaining the crowned sounding board in its original form. The back frame supporting the its original form its original form The cack trams supporting toe sounding board is reinforred by diagonal tension rods placed across each corner, as shown in the illustration The edge of the sounding board is rabbeted and gived into a continuous laminated rim built up of

hard maple veneers or layers so as to produce an

exceedingly strong construction, which, however, is sufficiently fiexible to yield under the pressure posts, with a view to equaling the outward pressure on the sounding board resulting from the stretching of the strings over the surface. By the use of screw pres-sur-posts, any shrinkage or expansion of the sound-ing board and the rim can readily be equalized so as to preserve the tone and even to amplify it. The arrangement is such that a proper reflection of the vibrations of the sounding board is obtained, as the strain on the sounding board by the strings is equalto reflect the tone

As a result of this new combination of sounding board rim and pressure posts a small upright planu can produce a tone which is comparable with that of mall grand plane, and the full round tone of the w upright piano is preserved because the sounding board is maintained in its original arched post-

EDUCATIONAL APPLIANCES FOR DISPLAYING ORIECTS. In the instruction of projection mechanical draw-ing, descriptive geometry, etc., it is important to be

EDUCATIONAL APPLIANCES FOR DISPLAYING CRIECTS

able to show students a skeleton model of an object. large enough to be seen by an entire class, and which will show front and side clevations as well as plan and bottom views. Heretofore this has been done by using a glass box within which the object was place using wire screens for the sides of a box, which per mitted the teacher to chalk mark the outline of the object. An improvement on this system is offered by the invention illustrated herewith it consists of a stand provided with axes that have automatic stops at quarter revolutions to arrest the model in various positions The apparatus comprises a vertical shaft A. on which is mounted a table B that carries a support C provided with a pair of upwardly extending arms support C has in its lower face four recesses adapted to receive a spring pressed stop pin D. The recesses are positioned at quarter revolutions of the support. unted in the arms of the support is a shaft on streament in the arms of the shaper is a search owner.

If a research the square blocks E and F The block
E is formed with four recesses adapted to receive the
H four the blocks are adapted to receive a clamp
If that carries the display stand J Model K is above
upported on the stand. Fir display stand may be
moved about on three axes which are fitted with index wheels so as to incline or turn the model about to any desired angle. The inventor of this educational appli ance who is My Hermann Hanstein of 2019 Mo Street Chicago, Ill informs us that he has used this display apparatus effectively in his own clas

### IMPROVED DETACHABLE WINDOW VENTILATOR

The ventilator which is illustrated in the accompanying engraving may be detachably secured to the window casing so that the window may be opened a short distance to permit the sutrance and escape of

IMPROVED DETACHABLE WINDOW VENTILATOR.

sir Furthermore, the ventilator is provided with an automatic damper, which acts to prevent the entra-

of unusually strong currents of air and is fitted with

shaped in section, and is fitted into a bracket at each end secured to the window casing. The lower edge of the casing is provided at D with a lip that engages the sill of the window Extending lengthwise

engages the sill of the window Extending lengthwise of the ventilator is a bar C, which is formed of about metal bent back upon liself to form a holder for two packing strips. I and R which extend to opposite directions: The packing strip D is adapted to fit against the saids of the window, while the other strip across as buffer for the damper. At the opposite side of causing ther I has a vertical reteation P which serves

as a baffle. The screen of stretches from the base of this extension to the bar C, and serves to keep out foreign bodies that may be drawn into the ventilator by the blast of air. The damper is indicated at H, and consists of a plate bent back upon itself at J to form a reinforcing bar while the inner end K is weighted so that the damps r will normally come to a balance on the axis L. When the window is raised the damper swings to the horizontal position as indicated, but if a strong draft blows through the ventilator it will strike the under side of the inner part of the damper, lifting it up until if the wind is strong enough, it strikes the buffer E. When the window is closed it

the end of the sist. If a large tool is used all the weed will be cut away except a single tenon, but if a smaller tool is used a central tenon may be cut, leaving enough wood projecting at each end of the sist to form enough wood projecting at each ean of the state to re-two more known. In this way a sist with three tenens can be formed, and by properly choosing the size of the tool and laterally adjusting the pedestal the sist may be formed with two tenons. The inventor of this sist tenoning marchine is Mr José Ojanguren, Calsada del Monte, No 358, Havana Cuba.

### IMPROVED JACK BLOCK

When the tournal bearings or brasses of a railroad

with the secondary star wheel F. The princip at secondary star wheels L and F are locally instituted collars on their remoutive shafts, and are housed becollect on their respective means, and are some se-tween separators H in such a manner as to prevent them from shifting thereon, yet leaving them free to rotate with the shart whenever it may be incommany for them to do no to ring the bell-ringing mechanism. The star wheel L is provided with teeth on its pari-The star wheel L is provided with teeth on its per-pherr, which teeth are adapted to engage rods project-ing from the star wheel N, whenever the star wheel L is released by the angle tripper JK. The teeth of the star wheel L engage a slide O, connected with a retractile spring-controlled clapper PQ, which rings

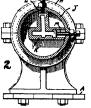

IMPROVED JACK BLOCK

illing it up that I the wind is strong enough it is strike in the biffer F. Whin the window is closed it positively close a the damper by bearing against the notice section I. The brackston which the casing is mounted are extensible so as to permit of using a standard length of ventilator with windows of different size. Each bracket is formed with a spring extension A, provided with a lug which is adapted to engage a stop pin on the window sash, and prevent car become worn it is necessary to lift the journals by means of jacks so that the brasses may be removed from the car axlo, and be replaced with new ones the window from being raised too high. Should it be desired to raise the window further it is a simple matter to withdraw the spring catch M The inventor of this ventilator is Rolla M Hill care of the Economy Ventilating Co Metropolitan Tower, New York The machine pictured herewith is designed to cut

When operating the jack it sometimes happens that the car wheel is lifted with the journal and derailed The purpose of the invention illustrated in the acsanying engraving is to provide a devi cylindrical tenons on the end of a wooden slat, particularly for use in window blinds. Window blind slats

will hold the wheel down while the journal is being will hold the wheel down while the fournal is being lifted, and form a level surface for the jack to rest upon The jack block is preferably made of malleable cast iron or steel, and is constructed in the form of a grating with the edges scalioped or corrugated so as to insure light-

ness without un duly weakening the stucture. At one end the block is provided with an ex tension B, terminating in toe C, which is adapted to fit over the rim of the car wh The lack black is rested on one of the sills of the ties of the inck in seated on the upper face of the block.

TRECKING MACRIMA

usually are provided with a single central tenon, but there is another type in which two tenous are used, and sometimes the slat is provided with three tenous. The machine is designed to form any of these types of slats. It consists of a base A provided with a central siats. It consists of a base A provided with a central bracket B formed with two barings C in which is mounted an arbor shaft. The arbor shaft is provided with a pulley B between the bearings, and may be fitted with tools, such as shown at P and G which depend for their form upon the nature of the work which they are to do. Opposite each end of the arbor shaft is a pedesial H fitted with a head J. In our illustration the head is broken away at the left hand side of the machine to reveal the interior construction. A cross sectional view of the head is also shown in Fig. 2 The head is formed with an interior web K, and the web is formed with a pair of channels that intersect center of the head At the upper end of the vertical channel and at one end of the horizontal writes channel and at one end or the horizontal channel is a spring such as shown in Fig. 1, which may be adjusted by means of the screws L and M, to bear against the work which is placed in the slot. It will be understood that the head J is revoluble within the pedestal H. The pedestal is connected to the base A by means of a pair of boits which pass through slots in the base plate thus permitting of a lateral adjust-ment. In use a slat is inserted in one of the channels in the web K, and the end of the slat is brought into in the week, and the end of the star is brought into contact with one of the cutters on the arbor shaft. The pedestal is adjusted laterally so that the center of the stat is out of alignment with the axis of the tool and then when the stal is fed against the tool and the head J is revolved a chreuker tenon will be but in

close to the ex tension B When the journal is jucked up the one serves to hold the wheat to the nil, relieving the upper journal bearing of the which the proper journal bearing of the wide of the proper journal period of the proper journal period of the proper journal period in carrying the block about a handle D is arranged at each aid of the body of the block, the location being such that the block is belanced when lifted The inventor of this juck block is by James Allen Gray of Gour of this juck block is by James Allen Gray of Gour d'Alene, Idaho

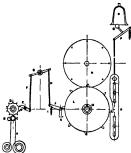

RINGING CRIMES BY PERFORATED MUSIC SHEETS. One of the pioneer inventors of the automatic plane player, Mr John McTammany of New York city, has ed a system of ringing chimes of bells by per forated paper music sheets, such as are employed in piano-playing mechanisms. Mr McTammany's scheme piano-playing mechanisms. Mr McTammany's scheme was evolved as part of a huge memorial to be erected to the memory of the men who fell in the civil war The memorial assumed the form of a monument in which each State was to piace two bells. To ring so extensive a chime by hand would obviously be a task categories a crime by nand would obviously be a task involving superhuman muscular power, Even the present mechanical and electrical methods would probably fall because of their complexity Hance, Mr McTammany devised the very ingenious system which

is here illustrated
The perforated music abset A is guided by a roil B,
and passes over a grooved roil U. The plus of a diriing wheel D are adapted to engage the perforations of
the music about A. The pin wheel D is operatively
connected by means of a 60g E, a coanceting red J,
a rook half U, a connecting roil J, and a name tripor JE, with a primary step, yebest J, which, coance

is here illustrated

the bell R The several shafts illustrated are gen

the boil R The several shafts illustrated are geared together in such a manner as to cause the several parts to ecoperate in definite order A tooth of the wheel D having entered a groove of the feed roil G through a perforation in the music sheet A, the wheel D turns on its shaft. In se doing it engages the dog E, which in turn through the conit engages the dop g, which in turn through the con-necting road p and H trips the angle tripper JK, thus releasing the secondary star wheel L, which, by the friction of its shaft, rotates into ongagement with the slide O, thereby pulling the slide down and withdraw-ing the clapper from the bell When the slide is re-leased by the Lewth of the star wheel L, the retractile spring of the clapper is released, so that the clap-per deals its stroke and rings the bell as the paris return to their normal positions. The wheel D strud-dies the feed roll, and is prevented from rotating ex-cept when one of its tooth fits into a perforation of

RIVOTES CRIMES BY PERFORATED MUSIC SERBIS.

the sheet and into the grouved roll, which turns the

primary star wheel one degree.

The playing of the bells can be giverned by clock mechanism, so as to strike the quarters and the hours and to play airs at stated intervals.

A new form of manying informpoor has recently been invented in which there are not reciprocating parts. but the interruptions are produced by a ripple formed in a sirean of parentry. The mercury is excluded in a reversing vessel within which a contact-piece is fixed. The mercury is theoret by contributed norse to the inner periphery of the wessel. At one point the stream of mercury is obliged to pass overy a dedector, precluding a ripple or wave, and the contact-piece his fixed to the mercury in the stream of this point is reverse with the wessel. The requires yet this fixer reverse with the wessel fix requires with the sensel. The requires point in the same directles as the vessel is revorted above in the same directles as the vessel is revorted above.

## It is Easy to make advertising

claims for cars; but to make cars that will make good the claims is hard.

We ask automobile buyers to do this: After the advertisements have attracted your attention, then in fairness to yourselves and all the manufacturers, compare the cars point by point. That is all we ask.

There are Chalmers dealers in all parts of the United States—more than 200 of them. We suggest that you get in touch with the one nearest to you at once. Let us send you his name if you do not know him.

### Chalmers "30" \$1500

Judged by price alone you might as well buy some other car as a Chalmers: \$1500 is simply \$1500—no more in one bank than in another, no more in bills than in coin, no more in your pocket than in another man's.

It is only when you begin trying to buy something with your money that the sense of value enters your mind.

Your \$1500 is worth more than another man's \$1500, if at all, only because you are able to buy more with yours than he can buy with his.

We believe that when you buy a Chalmers "30" your \$1500 becomes worth more than \$1500 invested in any other car. Careful investigation will convince you of this fact.

Please remember you are not buying a price or an adversistement: you are buying a car. Therefore examine the car on its merits.

If you investigate thoroughly a Chalmers will be your first choice, if you are able to get a delivery in your territory.

It is difficult to get more in a car, at any price, than you can get in a Chalmers "Forty" at \$2750. The "Forty" has all the power one can want, the quality to endure, beauty of line and luxurious finish. Seats for seven if desired. Catalogue "R" on request.

This range finder is the Batr and Stroud 9-foot, self-contained horizontal base type in case these are put out of action ranges must be doter mind by means of buoys or from observation of the

The firing of morters is far more difficult than that of guns. The detach ments at the mortars are completely con ecaled These weapons attack the deck of ships, and when fired their location cannot be discovered. They are set for elevation in practically the same manner as guns, but their direction, instead of being set on sights, is accomplished by laying the mortar on an azimuth circle In other words the moriar is set for as In other words the mortar is set for an idvation corresponding to the range, and at an angle of direction equal to the azimuth of a predicted position of the target orrested for wind drift, travid to. Many authorities considered mortars in past years to be so in accurate as not to authorize their consentation. struction but within recent years the results of tests and the records of tar get practice have shown that mortars are of immenso value to seacoust forti fictions Several companies in our coast artillery have made as high as 80 per cent hits at ranges of six and seven thousand yards when firing on a mov-ing target having a speed of seven or eight miles an hour and when firing but cight miles an hour and when firing but one mortar at a time Mortars have particularly great value in repelling a reconnoiseance in force as they can be fired with impunity without disclosing their location

Another important arm, if not most important arm of defense in the at artillery, is that of submarine test These weapons are designed to mines repel an attack when the hostile fleet attempts to come in during a fog or when the guns have been put out of action The system is so designed as to render mines harmless to friendly ships the mine commander as to permit their being fired either by contact or judg ment. The electrical principles involved ment in the control and firing of submarine mines is kept a secret. Ten years ago it took almost two weeks to plant a group of mines. To-day, by the use of mine planters, a harbor can be com blocked within twenty four hours The work that will devolve upon cons

artilicry troops in time of war will be of the most trying and patience-racking

is presumed in making this state ment that no fleet commander would attempt an open attack or "run by' in broad daylight but would await the carly dawn in a partial fog, when search-lights are useless and the spirit of the men at the guns at its lowest obb its would, without doubt, wear the gunners and cannoneers out and try their pati and cummusers out and try timer pair ence by making many sorties and feints during late hours of the night and osr-ly morning before making his final at-He would also if possible await his attack until cold weather set in and snow had fallen, knowing how dispir-iting ice and snow are to soldiers living in tents, as they would have to do during WAT

In the harbor of New York, for example, if war were declared all coast ar tillery would have to live in tents immediately in rear of the guns.

Would it not tend to breed discontent and dissatisfaction among soldiery if they were required to answer "call to arms" every hour during the night for about two weeks in bitter

This is the work the count artillery This is the work the count artillery will have to do when it is called to de-fend our country's ports from the inva-sion of a foreign navy It will be then that the 'brave the

E-M-F

There must be a mighty solid basis for the phenomenal success that has followed the E-M-F Company from the very first.

No other Automobile Concern ever has enjoyed the tremendous success this one has.

The whole world knows and all the world is talking about the Company and its cars, constantly. There must be a reason and it must be a good one. Even competitors admit that!

Everywhere, E-M-F "30" is first choice of that class of buyers who want all that can be had of efficiency, power, durability and elegance and comfort at a price under \$2,000. (E-M-F "30" sells for \$1,250 fully equipped with five lamps, generator, horn and magneto.)

The farther you seek for the reason for this greater popularity—for the splendid reputation achieved by this car in so short a time, the more does it appear that after all, the car itself is the real reason.

Ten thousand people are daily engaged in selling E-M-F "30" cars—largest sales force and the cheapest—for they all work for love.

They are satisfied owners.

fact that the astronomical day begins and
ends at Greenwich at noon, 12 hours later
than the beginning and ending of the civil or common day (the day we sleep and eat and work by), we should make it plain that all the illustrations and remarks apply to the civil one The astronomical day is a clean cut straight lin affair that needs no adjusting to prac-tice. The users of this kind of a day do not try to thrust its date line aside. The observatory at Greenwich was built right on this line and to make it more realistic a bronse tablet is set in stone with prime meridian (Zero Degree) en-graved on it so that it may be seen and felt by those who visit the observatory

The Energy of a Coiled Spring

The old question of what becomes of the energy of a coiled spring placed in sulphuric acid cropped up again before the Western Society of Engineers during a discussion on the conservation of en ergy Dr Steinmetz gave this explana-

The heat produced by the chemical The heat produced by the chemical sation in a coffed spring when dissolved, is greater by the amount of energy stored in it than if the spring were not under pressure. The amount of energy which is stored in compressing the spring in best measure is so instinuition to the contract of t done a greater best in dissolving than the uncompressed spring, in an indirect manner. The measure of the chemical conery is the electrical potential differ-ence. If one dissolves iron in an said and the iron is under strain partly com pressed, partly not one finds an unequal corresion due to local current between the different parts of the iron. If there is a local current it means that the diltial differences against the slectriyths that is different chemical silinities, and the part under strain is dissolved first, showing a greater potential difference and thus a greater best produced in its solution. Thus, if only a part of the spring were compressed, the other part on, the compressed part would dissolve first in the substurie acid by the local current dreating between the two, showing that it is solution given more desired than it administration given more array than that of the absolute given more present and the state of the absolute present part of the state of the absolute present part and that of the absolute present part and the present that the present the tial differences against the electrolyte

Thomas Bitimo resently took out a patent on an improvement in his storage battery According to the patent the active material for silenine storage batteries in impressed with an oxygen commass in a solution of a binnuth sull, then subjecting the material to centricular the control of the co

EMERY MANUFACTURING CO. Refiners of Pennsylvania Cru

The name Warner has for years stood for absolutery in practically every line where the determination and is a factor.

The Warner Horograph, an electrically-operated race of device, regeters bundredths of a second. It is so far-rior to any other that it was adopted at once by the onal Racing Amocasion.

near to any other that it was adopted at once by the onal Recing Association. And the Warner Auto-Meter bears among motorists youth title of "The Aristociat of Speed Indicators." In fact, the sole slogan of competition may be said to be, "It's chi-shifest."

LET US SEE WHAT MERIT THERE IS IN THIS CRY OF CHEAPNESS:

No expense whatever is geared in its construction. Accuracy and dependability are note aims. It is built with the same care and theoroghous as the finest watch. Yet the demand for the Warner Auto-Mater has norround or rapidly that our et has been quadruphed within two years. And our factory is the best equipped of and in the world.

How, then, can sayone dae make the same quality more cheaply than we? Must there not be a reduction in accuracy, in reliability, in quality, to offset closur spore? Judge for youself. And remember, that the Warner Auto-Meter is constructed on the only pract th experience had demonstrated to make accuracy under all conditions—many

## The Overland **The King of Cars**

It requires four factories, employing 4,000 mm—taroing out 140 Overlands duly—to meet the flood-like demand for these cars. Yet two years ago a hundred virsals had a larger stage. The reason lies largely in the car's utter amplicity. Its able deagner made it almost trouble-proof the created an engine which, for endamnoc, is the marvel of engineer-line.

He designed the pedal control One oes forward or backward, slow or ist, by merely pushing pedals The ands have nothing to do but steer

or trouble.

The Overland always keeps going, and almost cares for itself. All the unual complexities have been climinated.

nated.
That is why each car sells others, and our orders for this year's Overlands amount to \$2.5,000,000.
Another fact is that no other car gives nearly so much for the moment of the contract of the contract and the fortunes leveled in our automatic machinery. It would bankrupt a small maker to try to compete with us.

pete with us.
You can get a 25-horse-power Over-land, with a 102-inch wheel base, for \$1,000 You can get a 60-horse-power Overland, with a 112-inch wheel base, for \$1,250 The press include lamps and magneto.
This car, which has captured the country, is the car you will want when you know it.

### Two Free Books

THE WORLD'S FAIR OF THE FUTURE \ all probability the city of San Francisco will hold an international exposition, or as it is hold an international exposition, or as it is more popularly known a World's Fair to elebrate the opening of the Panama Canal in 1915. If the promoters of the fair are willing to profit by the lessons of former expositions their efforts will be directed to making the coming fair notable not bulk and area but for its compactness and the genuine excellence of its carefully selected exhib the grauine excellence of its carefully selected exhibits. The trouble with many previous expesitions has been that they were big to the point of being wearl some and oppussive. A climax in this direction was resched at the St. Louis Fair. In one single building of which a visitor had to traverse nine miles of ables if he wished merely to walk past the whole of the exhibits. Whatever may be the ulterior motive, the avowed object of these exhibitions is educational Therefore, they should contain only the most dis-tinctive and valuable results of the world's scientific industrial as injected and constructive work. And this connection we would ask whether it is not almost an insult to the good taste and intelligence amoust an insult to the good take and intringence of the millions that are solitate to enter such an exposition If a large section of its space is devoted to that cheap form of entertainment which was inaugurated by the notorious Midway Philanane at the Chiergo Exposition San Francisco will have a great opportunity by breaking away from certain false traditions to render this, the latest of the ex-positions comething better than a mere plaything of the malestate dealer the side show man, and the poll

### GYROSCOPIC EFFECT OF REVOLVING AEROPLANE MOTORS,

SITTRE were certain conditions in the rece fatul secident to Le Blon which suggest that the gyroscopic effect of the motor may have contributed to the disaster. He was using a light monopina of the Herbot type driven by a Gnome revolving motor. The aeroplane, although any aparently instat and in good working order be ansumanageable and truring completely over, fell to the ground Now, the gyroscopic effect of the 187 pound motor running at 1,200 revolutions per min ur, must have been considerable A sudders turning of the aeroplane to the right or left by the aviator would produce a strong upward or downward gyro scopic tipping (endency in the longitudinal direction if this undency were aggravated by a gust of wind it is conclivable that the aciator would be unable it is concelvable that the acistor would be unnow to control the situation sufficiently to prevent a com-plete upset. At the time of his fall Le Blon was fly lurg above the bay at San Schastian Spain, in a bigh gusty wind is it not possible that the joint action of the wind and the gyroscopic effect of the engine and propeller was responsible for the disaster? The and properties was responsible for the disaster? Interactic death of la lagrange when he was using a monoplane equipped with the same type of motor suggests that his sudden upset may have been due, in some measure to similar causes.

OUR PRODUCT IN OUR OWN AND THE BRITISH HAVY E are frequently asked by correspondents to give some comparative figures show ing the relative excellence of the shoot ing in our own and other navies. We would gladly do so, but it is a fact that there is no information regarding the navies of the world more difficult to obtain than this France and Germany, in particular never giving to the world the results of target practice Both the United States and Great Britain however, do publish such figures. But even here it is often difficult to establish accurate comps sons, because the data which is made public is a dom complete, either the range or the size of the target being frequently omitted, and no statement target being frequently omitted, and no statement being made as to whether target or ship or both were moving However, we offer the following compari-son, which is based upon official figures. The Engineer of London states that the results for

the past year have shown that each 12 inch and 10inch gun has averaged 063 hit, each 92-inch gun, 194 hits, and each 75 inch gun 247 hits, these b the average number of hits per gun per minute for the whole navy The 6 inch 47 inch, and 4 inch guns varied from slightly over 4 hits per minute for the

6 inch to 9 hits per minute for the 4 inch By the courtesy of Rear Admiral Mason, Chief of the Bureau of Ordnance we are enabled to publish the average results obtained on all the guns on all the ships taking part in target practice in the United States navy. Whether the ranges and the size of the targets corresponded to those in the British navy, we inspets corresponded to those in the British may, we are unable to say The results are, for the 12 luch guiss 0.72 lift per guin per minute, for the 10-inch, 0.75, for the 8-inch, 183 and for the 7 inch, 313 lifts per guin per minute, while the results obtained with the 6 inch, 5-inch, 4-inch, and 3 inch were practically the same as were obtained in the British navy One 7same as were obtained in the British havy One r-inch gun holds the remarkable record of 1028 hits per minute, while the highest acore with the 12 Inch gun firing when the ship was under way in smooth water, was i hits per gun per minute obtained on the United States ship "Obto"

### CERTAIN ADVANTAGES OF LIQUID FUEL

¬O judge from a succession of articles which have been appearing in one of the newer and certainly the most noisy of the London and certaint the bloss noisy of liquid fuel in the British navy, one would suppose that the virtues of this fuel had only revently been discovered and the the Admiralty had determined to abolish its coal depots and turn the bunker rooms of its warships into eil tanks. As a matter of fact any such sweeping subatitution of oil fuel for coal is not now contemplated nor ever will be either in the British or any other The natural sources of oil supply are not suffi DOVE cient in capacity nor are they so widely distributed, as to make it possible either for the merchant marine as to make it possible either for the merchant marine or the navies of the world to make a wholevale sub-stitution of oil for coal. Some countries notably the Inited States and Russia possess such abundant sup-plies that they could, if they so wished, make a much more complete use of oil, and, because of this advan-tage it is not unlikely that our navy at least will ultimately make a more extensive use of oil fuel than

The navy of any other power

The advantages of oil over (oal are so many that were there as much oil in sight as coal the new fue would in vitably supersede the old altogether. In the first place, the higher evaporative value of liquid fuel not only enables a larger quantity of fuel to be carried in the same space but its use renders possible a decrease of 75 per cent in the number of stokers or fire toom attendants. Being in the liquid form it or are toom accondance. Being in the inquig form it can be employed as ballast and pumped into remote quarters of the skip far removed from the boller room and inaccossible for the handling and transportation of coal. For the merchant ship this means not only a saying in the fuel and labor bill, but a positive gain in cargo capacity, while for the warship there is a similar reduction of expense and what is of far greater value, a considerable extension of the crule-ing radius or the distance over which the ship can travel without replenishing her fuel supply. For the merchant ship there is the further advantage that the bunkers can be filled by a pipe line without the delay, dirt and disorder which accompany the present coaling operations, while for the warship there is the strategic advantage that the ship can take on fuel b; a pipe line from a tank ship at any place and in any but heavy weather Furthermore, the use of oil enables a whole fleet to steam without emitting those tell tale clouds of smoke which are one of the surest means of betraying its presence to the enemy

### ARCIENT AND MODERN TRRIGATION

STRONG contimental interest will be aroused by the announcement that the great in tion works which at the very dawn of history rendered the land of Mesor garden of fertility, are now being repeated on an activative scale under the same engineer who was responsible for the very successful irrigation works in the valley of the NIIO our United States Consolinate States Consolinate States Consolinate States Consolinate Consolinate States Consolinate Consolinate States Consolinate Consolinate States Consolinate States Consolinate Consolinate States Consolinate Consolinate States Consolinate Consolina garden of fertility, are now being repeated on an

value, according to the Turkish government, will be \$155 per acre, the soil being capable of yielding large crops of wheat, barley, and cotton. We spoke of sentiment entering into the interest

We spoke of septiment entering into the interest with which we regard this work, and there is containly something that appeals strongly to the imagi-nation in the fact that both in ancient Egypt and in nation in the fact that both in success Egypt and in were more ancient Mesopotamia, the Anglo-Eaxon, after a lapse of four or five thousand years, should be repeating on a larger seals and with the greater akill rendered possible by modern appliances those feat irrigation which are one of the chief girsts of the ancient, but never-to-be-forgotton, racon that once fourshold in the valleys of the Nile and the Eughanus. Whatever may be the future rate of the great As-

gio-Saxon race, the vast works of irrigation which it has carried out in India and in Egypt and is now seeively prosecuting in Mesopotamia, must ever stand out as one of the brightest evidences of its civilizing and uplifting activity

During the recent progress of President Roos-veit down the valley of the Nile, his visit to the great reservoir at Assouan and the sight of the marvelous reservoir at Assouan and the signt of the marvesions fertility with which it has enriched the valley below, must have carried his thought to those swen greater works of trigation which are now being prosecuted in the arid region of our Western States; prosecuted in the arid region of our Western Stakes, works which owe their inequious largely to his own tireless energy and enhulsams. Horse also the laised and most powerful branch of the great Anglo-Baxon raw, in the space of a few years, has completed the initial work for a project which promises to bring thirty million acree of unproductive and under the richest cultivation. And in the connection it is timely to draw attention to the great ability with which the Reclamation Service has done and is now carrying on its work A well-deserved tribute to the engineers in charge was recently made by Senator Yowland of Novada in which he stated that the proects had been for the most part wisely selected crit had been for the most part wheely selected and the work well done, such milatelee, mose of them serious, as have been made being the result of the serious, as have been made being the result of the extraordinary pressure brought to bear upon the Re-imanton Service by the political representatives of all the control of the political representatives of services organized that has ever existed in the hier country. The Committee on Irrigation of the Squate has been emanged during the past year in visiting these various works, and not a whisper of corruption has reached them. It has been a work conducted with are intelligence, with near laterity, and with rare speed,

The work already accomplished consists in the provision of dams headworks, etc. and the \$30,000.000 now required is for the purpose of utilizing the water so stored, by the construction of canals for dis-tributing the supply upon the millions of acres which only await its arrival to spring into instant fertility.

### TESTS OF TURGSTEN LAMPS

a bulletin recently jasued by the University of illinois T. H. Amrin, and A. Guell present the results of an important study of various types of tungsten and incandescent lamps a study which should prove of considerable interest in view of the growing importance of metallic flament illumination The conclusions of their investigation may be thus

Comparisons of the durability of filements made by the colloid, deposition, and paste processes are very difficult to make because the three types are usually mounted differently Undoubtedly the manner of mounting the filament has a great effect upon its life, and whether the superior life of one type lamp is du to the fact that it has a better scheme of mounting or to the fact that the process of manufacturing is bet-ter, can hardly be decided definitely from these tests. ter, can hardly be decided definitely from these tests. Tests of filaments made by the three processes and mounted in exactly the same way would be necessary to decide the question definitely From the tests de-scribed, however, the colleds process seems to give a filament that is less durable than the other two. The diament that is less durable than the other two. The tests show that performances of ungains lamps vary to a surprising degree, depending upon the kind of lamps used and upon the conditions under which they are burned Some lamps will give as high an operat-ing cest as the old carbon lamps withis burning under certain conditions, whereas other jumps will give good results under those same conditions. Under the best conditions, however, the tungsten lamps now on the market give excellent results. "Hest efficiency is ed in a remarkable way and the life is very long, often several times what the advertised life is Breakages in shipment and handling have been re-duced to a small fraction of what was formerly comduced to a small fraction of what was formerly com-mon of, three hundred lamps purchased for the tests by the experimenters, only three were received with broken filaments; and although the lamps in some of the tests were handled doesne of these, almost no trouble was experienced so far as the breakage of fila-meats was concerned.

### ELECTRICITY

At Exercit University a wireless telegraph club has been formed with a view to studying wireless telegraphy, and one of the special objects is to discover some method of overcoming amateur inter-

Some time ago the United States Steel Corporation installed two Heroult furnaces, one at Worsteen Hass, and the other at South Chicago These for mace have been in constant service ever since, doing twelve bests per day it requires between an hour and an hour and a half to reflue a martie ton of steel and 100 kilowath hours are consumed to describe the control of t

A test of the telephone service in Wikonaia was recently made by a cannination. The investigation was carried on servely, so as to determine the actual conditions of service it was found that the average time between a call and a response was 478 seconds and the allowest are 78 seconds and the allowest in 78 seconds and the allowest in 78 seconds and the allowest in 78 seconds and the storest in 78 seconds and the storest

It is remarkable that while witches belgraphy has made rapid strides very important considerations have been atmost entirely neglected. Much attention have been atmost entirely neglected. Much attention has been pattle to attenment and selectivity and also to the removement of the automates while the development of the automa has been slow. At the, reviewing attains particularly not much has been done toward containing the automa has been standard to a standard to the automate of the standard of the standard has been attentions and also made to the standard has been extensively adopted in practice.

A telephone cable board with Papin colls was laid in Lake Constance in 1906. This was a lead-covered cable and it was very difficult to lay it on account of its great weight. Mr Diesel-hors, who laid the cable has been experimenting with leaded submarine the photos cables and has evolved a construction with his photos cables and has evolved a construction with his don with Paris. The cable is covered with guith don with Paris. The cable is covered with guith specha and wire absenting and the loading cells have been introduced so ingeniously as to increase the disaster of the cable from one into he but three ins less for greatesty in the cable swelled at the leading points that it can be paid out over a forf out sheaves wheel months, and from time to time has been subjected to pressure of four ions per square lark.

A section of tests has recently been made to derive mine the strength of the metallic finaments of lamps and their resistances to shock. The lamps were tested by placing them at the bottom of an inclined purpose, and rolling rubber bails filled with lead down the plane. The shock was varied by starting the lails at different distances from the lamps it was found that with lamps of equal rollary the strength to the filament varied invreely as the candle-power and for lamps of equal candle-power the strength varied inversely as the voltage in some lamps it was found that certain parts were more sensitive to shock than the filaments. When the filaments were heated to a white heat they became too finalitie to be broken by a shock, but the loops were distorted under repeated blows until they came to contact with each other

Sterilization of white wine is the object of a paper presented to the Academic des Sciences by Meser. Maurala and Warcollier Previously they studied the action of ultra-violet rays from a quarts mercury raper lamp upon edier in fernantation. With the white wine and found how much time it took for the rays to act upon different thicknesses of layer so as destroy the fernanting principle and thus prevent any now fernmentation. Using layers of vise of \$\frac{1}{2}\$ until the prevent any now fernmentation. Using layers of vise of \$\frac{1}{2}\$ until the prevent any now fernmentation. Using layers of vise of \$\frac{1}{2}\$ until the prevent any now fernmentation. Using layers of the lamp so that the part of the lamp and a place plate and exposed to the lamp so pours below 5 seconds. With 17 millimeters (0.07 linch) exposed at the same distance from the lamp course below 5 seconds. With 17 millimeters (0.07 linch) exposed at the same distance from the lamp formatication was always stopout after an exposure of over 1 minutes and never 10 less than 30 seconds. It is striked to the lamp of the lamp and the lamp of the lamp of

### SCIENCE.

Prof. Biliprocht's tablet, said to uphold the Biblical account of the Duluys, was discussed at a meeting of the American Oriental Society at the Johns Hopkins University, Teof. G. A. Barton of Biryn Mawr College, Prof. Paul Haupt of Johns Hopkins University, and Prof. Albert T. Clay or Yale University, thought that Prof. Hiliprocht had been too imaginative in interpreting the transmentary inscription. It is asserted that the restoration made by Prof. Hiliprocht and in broken lines were conjectural emondations. Prof. Hiliprochts claim that the tablet was written some the professional states of the professiona

The price of pure Para India rubbr, which in 1802 was 88 cents per pound, rose hat year to \$2.25 per pound. This increase in price gives additional interest to the processes of regeneration of waste rubber and of the manufacture of substitutes. The regeneration of vulcainsel findia rubber consists in removing the sulphur, which was added in the process of vulcainse. The warm rubber is made in the process of vulcainsel into The warm rubber is used on the process of vulcainsel, the process of vulcainsel, the process of vulcainsel, the process of vulcainsel, the process of vulcainsel to the process of vulcainsel, and the process of vulcainsel in the subbur of vulcainsel in the process of vulcainsel in the subbur of vulcainsel in the process of vulcainsel in the subbur or subbur applied by resulting financed of livel supplier or subplier.

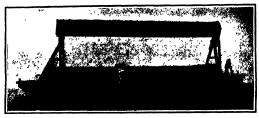

One of the most interesting results of the Smith sonian African Expedition has just been published by Mr Gerrit 5 Miller Jr (urator of the Division of Mammals U 8 National Museum under the title of Description of a New Species of Hippopotam There have been for some years in the collections of the National Museum two skulls of hippopotami, one of which was from the Zambesi River East Africa and the other from Angola West Africa. These skull differed materially in several details of form chiefly 7 hese skulb however in the constricted shape of the rostrum, but the characters were not deemed of sufficient va justify the creation of a new species for the differ ences might have been due to individual variations The receipt of eight skulls from British East Africa collected by the Smithsonian African Expedition showed conclusively that the individual variations were so elight in the East African specimens that Mr Miller was led to believe that the two skulls repre sented two distinct species one from East Africa and one from West Africa A critical study of the sk revealed other differences in their characters that were of sufficient importance to justify Mr Miller is making a new species of the West African specimen to which he gives the name constrictus

The gas bega of modern balloons are made of a cot on fabric control with India rubber in the most careful manner, in order to source perfect impermebility without surficing likshress For all large balloons, and especially for dirigibles two layers of cicht are superposed and comented tog their The outer skin is revered with India rubber on one side only but the inner skin is coated on both sides in derman balloons the inner cauvas is cut straight and the outer saves is cut bein as in the caustra in the cauvas is cut straight and the outer cauvas is cut than in this caustrate one series when the cause is sufficient to the cause of the

### THE "VIRING" SELF-DUMPING DECK SOOW.

BY THE REALIST COMMENDEMENT OF THE RESERVE ABEREAN
A novel system of self-clumping seven sepsicilly designed for the discharge of rock and solid dibris has
been devised by Mr. A. F. Villing enginer and shipbuilder of Sick known. At this port the economical
dumping of such material into the water is of part
tudus interest inanumb as the blasting of rock in

equilibrium of the latter is spect usersly by foreign start through the searcy of compressed art include start through the searcy of compressed art included should be lost. Should the frush deck be fitted with low bulkarks, these are fashloned in the forms of bot time hispad doors on the discharing side, so that they fall down as the burne besis over, and permit the load to be sinct cleanly.

After dumping, the seew returns to an even keel.

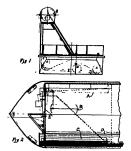

connection with the extensions to the harbor or the sixtees of the (ity is in continuous progress. Several designs for automatic damping have been evolved the the Viking's system so called after its designed, has been the first to be submitted to practical test and has provide remarkably successful. Through the courtesy of the inventor we are enabled to illustrate and deerthe this new targe. It differs in its action from any In the hold of the scow on the side opposite the elevated cylindrical tank is carried another tubular tank A about haif the length of the former. This is filled with water, and in the case of the scow libed with values of the cover holds about sat tons for a load of 200 tons on the dreck. Alongside this water tank is a small cylindrical vessel? Be containing compressed air the pressure being approximately seven atmospheres. On the same side as the elevated tank in the hold below, is a third cylinder C sha shout haif the length of the clevated

compressed-sir ressel is also consected to this waive box, but is shirt of from the same until ready for dumping. The thirty ressel below the elevated quinter, a siready monitoned, is always open to the free stmesphere through a pipe, but there is a second pipe said valve provided in consection with the mail communivated cylinder. It will thus be seen that there is always open communication between the first water tank and the elevated cylinder by means of a main ple which is carried up alongside the vertical lag of the tripod at one end. In addition there is a smaller at pipe running up one of the triangular legs and passing right into the body of the tank, having it and position grate that the cylinder maide. This bigs is maily the upper vassel is full of air.

The load is stowed on deck in the manner shown in

The load is stowed on deck in the manner shown in the illustration. When rock is handled, bulwarks on three sides only are necessary, the fourth side from which dumping is effected, below the elevated tank, being jett quite open or at the most having only a lowering. It soft material is carried, hinged doors, as already described, may be used, these automatically opening under the pressure from the load on deck when the scow is inclined in the dumping operation, and falling flat and clear so as not to obstruct the shoot. When the loaded barge has been towed to the dumping site, a cord is pulled connecting the mechanicing site, as cord is pulled connecting the mechanicing

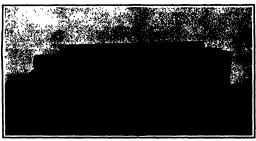

When the loaded barys has been towed to the dumping site, a cord is pulled connecting the mechanism of the scow with the tug 'This opens a valve, which permits the compressed air to flow to the valve box, and also a slide valve in the latter, whereby the cempressed air is admitted into the lower water vessel A. The pressure exceted forces the water from the lover task into the shevated cylinder, D. the displaced air was the control of the control of the control of the charge of the control of the control of the control of the related to the control of the control of the control cord is again pulled, the side valve in the control cord is again pulled, the slide valve in the

 $A, B, \ell^+D$  are ballest tanks by the emptying and filling of which the second is damped and righted

### WALLEY'S COWET AT ITS REIGHTEST

RENET ROBERS RUSSELL, FR D , PROFESSE OF ASTRONOUT

It may have seemed remarkable to many people that so long a time has elapsed since the first observation of Halley's counts at its present return, and yet it has not shown itself at all to ordinary eyes. The accommanying illustration (Fig. 1) will help to explain this when first detected last September with very powerful tolescopic and it was fire beyond the illustration of the and nearly as remote from the earth. At first the two

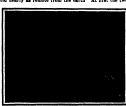

Fig. 4. Spectrum of Haller's comet

Photographed at the Yorkes Observatory by Prof. Frost, January 14th 1910. The appetrum of the comet is in the middle between the two brightest star-appetra. Nee description in text. The blue end of the spectrum is on the right, the situ-violet on the left.

bodies approached each other rapidly, but before the ond of the year our planet crossed the line joining the comet with the sun, and by January lat, as the figure shows, we were moving almost straight away from it During the early part of the year the earth and comet passed on opposite sides of the sun, so that it was less to our yele early in March.

About the time that this is printed it will come into sight sagain, on the other side of the sun rising before daybreak. But now its path has curved so that it is coming toward us—limed tirredly, if we take our motion into account as well as its own if therefore seems to stand almost still sanog the stars, while might tell by its more change in appearance that it was approaching us rapidly

Finally, about the middle of May the comet will apparently approach the sun again, and on the 18th it will pass in front of him, literally between us and the sun, transiting the latter's disk. If at this time its tall is more than Sirken million miles in length we will pass through it, as the Sirve shows.

will pass through it, as the ngure anowa."
The comet's closest approach to us comes two days later, on May 20th, when it is but fourteen million miles away. For a few days following this it will be splendidly visible in the evening sky, and then it will fade gradually as it recedes from us.

This clear from the diagram that this apparition of the const. is as exceptionally known in a special conf. for it is clear from the diagram that this apparition of the const. is as exceptionally known in the constant of t

nomically speaking, almost over our south pole, and quite invisible from northern latitudes. It therefore appears that the present conditions are almost ideally favorable for observers placed as we are, north of the

The illustration on the first page shows better than any verbal description where to look for the comet in the morning sky in New York The moon and Venus

Fig 1 —RELATIVE POSITIONS OF HALLEY'S COMET, THE RARTH, AND THE SUN

are shown in the positions which they will occupy shout May ist, when, on the whole, the come can be seen to the best advantage. At an earlier date, Yenus was higher in the sky, compared with the comet. There was less trouble then from moonlight, but the comet did not rise so early—about 4 A M on April 15th as against 3 A M, on the later date

The councils brightness when it appears in the even ing sky about May 20th will be sufficient to render any finding diagram unnecessary. It will only be needful to look toward the west half an hour or more before the council sets which it does at 8 20 P. M on the 20th 9 15 on the 21st, and 9 55 on the 22nd, after which it will be clearly visible until after 10 P. M.

Our other illustrations which appears here through the courtest of Profe Frost and Barnard of the Yerkes Observatory show the appearance and character of the comet earlier in fits apparation Fix 2 illustrates its extreme faintness at the time of its rediscovery (which was announced by Prof Wolf of Heldelberg less than a wock before the sarriest of the four photographs here shown was taken) while it was still do million miles distant, both from the earth and from the sum of any one piach it is difficult, if not impossible to distinguish the comet from the multitude in the same of the same of the same is also says one piach it is difficult, if not impossible to distinguish the comet from the multitude of faint stars around it, but no comparing the four which show exactly the same region of the sky? it is easy to see that the stars are the same in all, while

is easy to see that the stars are the same in an, vame the comet is 'here fedsy and gone to-morrow'. With the great Yerkes telescope (which gives far smaller and sharper images of the stars than can be reproduced on any known photographic plate) the comet was even at this time quite different from the stars in appearance, in Prof Barbard's words, "a feet, of light surrounded by a faith rebulosity" with no

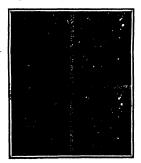

Fig. 2.—Halley's comet at its reappearance in 1909.

He is find after his course from highly to highly.

definite boundary His measures, made on several nights, show that its actual diameter was about 12,500

Our second illustration, from a photograph takes when the come was 145 million miles from the sun, and 153 million from us, shows it already well ad awared in the changes which invariably accompany the approach of any considerable comet to its peribalion. The head of the comet has become larger—nor merely in apparent size, owing to its approach to us but creatly in miles, while a faint should be comed to a because the contract of the comet and the context of the come take the context of the comet and the context of the comet and the context of the context

away from the sun, makes its appearance
As Fig. 1 shows, the tail, which extends directly
away from the sun, was at this time also nearly in
line behind the head as seen from the earth so that
its actual length must have been much greater than
it appears to be—about five million miles, according
to Prof Barnath

This considerable development of the tail, while the comet was still at two and one-half times its least distance from the sun, makes it probable that at and after the perhelion passage, on April 20th it will be much longer, probably long enough to envelop the earth as it zweeps past.

Our third illustration shows the spectrum of the comet photographed on January 14th, when it was about 170 million miles from the sun

In taking such a photograph, a prima is placed in rota of the camers. The light of a star is thus drawn out into a line which, by leiting it trail on the plate is brademed into a hand, romeed by the dark lines which tell us what absorbing games exist in the star a stmosbler Most of the objects on the plate are the spectra of stars near the conset obtained in this way recommended to the plate are the spectra of stars near the rotation of the star of the spectra of the star indicts between the value of the spectrum of the star indicts between the which were produced by supplementary exposures on some bright star, and serves as reference marks to find the position of the lines in the spectrum of the consistent lited? The latter unlike that of the stars consists

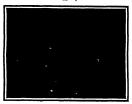

Fig. 8.—Halley's comet on February Srd, 1910.

From a photograph taken at the Yerkes Observatory by Frof Barnard.

As the instrument was kept pointed at the rouned during the exposure
the stars appear as short streaks. The actual length of the
comet a tall is about two million sales.

mainly of bright leands or lines three of which are conspit uous. The brightest of these as is shown by comparison with the hydrogen lines of the comparison spectrum is the so-called syanogen band at the or trene violet and of the visual spectrum. The others are probably as in the case of other cometa, also due to gaseous compounds of carbon.

Between these bright bands can be seen a faint con-

tinuous spectrum, due to refected similight. When the roomst first appeared the photographs made at the Life Observatory showed this continuous spectrum alone. At that time it must have been shining entirely by reflected light, but by the date of neillimitation it had already beam to be self-lumi nous. This is corroberated by the fact that fis bright mean increased may have more increased in the amount of reflected to the control of the

This intrinsic light of the comet, as its spectrum shows, is given off by luminous gas, but we do not yet know what makes this gas shine. It can hardly be high temperature, for the come the district come from the depths of interplanetary space, and did not yet receive nearly as much best from the sun as the sent office. It must however, be due to some kind of solar sarction, for it increases very readily as a comet approaches the sun. We can reproduce the same specially in the sent of the same special control of the same special

of carbon and nitrogen at very low pressure.
It is of special interest that, even if the carbon compounds form but a small percentage of the gas in the tube, that spectrum becomes relatively prominent when the pressure is made very small is any 1/100 one of that of ordinary air. It may be, therefore, that at ceptional capacity for shining, and it would be unasted to conclude that there are the principal gaseous con-

stituents of the comet, because they give off almost all the light

It may be added that the cyanogen bands in the spectrum are produced not only by the poisonous gas of that name but in all cases when carbon and nitrogen are together under electrical excitement. For example they are very strong in the spectrum of an ordinary are light where the aftrogen comes from the are and the carbon from the terminals. It would be about as prasonable to conclude that an arc light was potennous after looking at it through a specifrom a distance, as to make the same deduction about

Whatever may be the origin of this intrinsic light of comets it is responsible for most of the phenor which make them of general interest for almost all the light of the tall as well as of the head of a bright comet is of this kind. If Halley's comet shope by reflected sunlight alone it would be barely visible to the naked eye, even under the most favorable circum.

Actually owing to its intrinsic light it has be uous object at every return for the last 2,000 The only gap in the record—in A D 912—has lately been filled by the discovery of unmistakable references in old Inpanese chronicles.

the usual quantity of matter composing it must however be very small as compared with the more familiar heavenly bodies. It is possible to form a rough guess as to its amount by considering the amount of light which it reflects when it is not shining on its own account. From the estimates of magnitud made last September, it appears that a single bod made last september, it appears that a single body only a little over 30 miles in diameter at the distance of the comet would have sent us as much reflected light provided that its reflecting power was equal to that of the moon, which is lower than that of most of the planets

It is, therefore clear that the comet must be co posed of separate particles widely separated. T whole cross-section of the comet (12,500 miles in dia eter) is about 120 million square miles, while the total area of all the reflecting particles, according to the above estimate is about 1 000 square miles. A ray of sunlight falling on it has therefore less than one chance in 100,000 of being stopped, and all the rest of chance in 100,000 of being atopped, and all the rest of setting through some cuptly againer it is no wonder that commits are transparent, and that stars can be that commits are transparent, and that stars can be particles were, we could now estimate their number and their total mass. But here we are quite in the dark. As the light of the connet seems uniformly dif-lused and it shows no signs of resolution into points of light, the number of particles composing it must at least be counted by thousands. Their average diam-tations are the committed of the composing it must at least be counted by thousands. Their average diam-ms were moreonable in after it all sathered into may vary enormously in size if all gathered into one compact group they could at most hardly exceed in bulk the satellites of Mars or the smallest of the

But how much smaller than this limit their actual dimensions may be we do not know if, purely for illustration, we suppose that they average an inch across, there would be some five or six million millions of them. This sounds like an enormous number, but we calculate the bulk of the comet we find that there would be only five or six particles per cubic mile of space on the average inside it Near the center they would doubtless be more closely packed, and more thinly toward the outer parts of the comet.

The combined bulk of all these particles would be about 80 million cubic yards a large amount from the engineering standpoint but not equal to the quantity of water which falls within the limits of the smallest State in the Union during a heavy reinstorm

This may serve to give us some idea of the extreme tenuity of the comet as a whole - if we took a space as big as the comet, that is, half as much again in diameter as the earth, and sowed ordinary golf balls through it at the rate of two or three per cubic mile, leaving the intervening space absolutely valent we would get something that would look quite as bright as Halley's comet - if out alongside it when it first

The gaseous matter which gives most of the light at perihelion probably cozes out of the solid particles as these grow when under the sun's heat when they approach it As the gas becomes luminous under solar action, the brightness of the comet increases and its regions originally invisible because the number of reflecting particles was too small to influence our eyes, gradually come into view

me of this is repelled from the head of the com boile of this is reperied from the near of the counce, by little known, force, and driven away from the sun by the action of the sunlight which, as is well known, exerts a force of rejuision which, if a particle is exceedingly small as are the gasoous molecules, is stronger than the attraction of the sun

Thus arises the long and magnificent tail which, like the anoke-trail of a steamer at sea is ever being renewed at one end and fading away at the other, even though it seems to accompany the comet'in its'journey

As the comet recedes from the sun, much of this fine outs matter has thus been lost, never to be re-gained. Some of the remainder probably condemna-tound the solid particles when they become cold, and

es apes into space

The comet is thus gradually losing its s and in the course of ages it may be deprived of all its tall forming material, and lose its former glory This seems to have actually happened to some of the short period comets, one at least of which has disappeared altowath. r

Halleys comet is perhaps preserv fate by the longer interval between its returns to the region near the sun, where its activity takes place. It may be, too, that it has more of the right sort of material to spare for a tail But the time may con when most of this is lost, and its successive appearances may gradually lose those impressive features which have so long inspired awe and wonder in the hearts of mankind, and dwindle at last into something which the professional astronomer alone will be in

The Mercury Vapor Lamp and Its Effect on the Rye, About a year ago we published a reference to a report of Prof J Norman Collie, FRS, stating in effect that a German medical journal had described certain cases of alleged injury inflicted upon the eyes by rays of mercury vapor lamps. These cases referred to all prove to have resulted not from the mercury to all prove to have resulted not from the mercury vapor illuminating lamp, which is now so largely in use in this country and which is constructed with a tube or container of glass, but from a special lamp used in medical sterilization, and chemical processes, having a quartz container. The medical or sterilizing lamp, to be sure, uses mercury vapor, but its containe being of quartz, it is transparent to those rays which being of quarts, it is transparent to those rays which way be fulfillious to the syrs, while glass is quaque to such rays and does not permit their passage. The quarts lamps referred to by Prof Collie are inter-tionally made to centil perm-destroying raws Dr. Claries P. Richmett who has made a careful study of mercury vapor lamps used for illuminating pursecs, stated in an article in the Electrical World and Engineer of February 21st, 1903, as follows

The nicroury are therefore is the only known arti ficial illuminant which is perfectly harmless and thus especially suited for use where accurate work has to be done by artificial illumination, as in drawing rooms

offices, factories, et The same scientist in an article in the Daily Union, Schenectady N Y, on January 17th, 1903, stated as

"Therefore electric lights are less harmful than gas or oil lamps, being whiter, and the white daylight the least harmful while the mercury are light which is entirely devoid of red rays, is absolutely harmless, and a person can look straight into one of these mer ury area of enormous brillian y without being blinds by it

In one of Dr Steinmetzs books entitled "Radiation, Light, and Illumination" he makes the following

The harmful effect of working very much under artificial illumination is largely due to its energy effect, incident to a large amount of orange, red, and espe-cially ultra-red in the radiation of incandescent bodies used for illuminants and thus does not exist with 'cold light, as the light of the mercury lamp"

### The Current Supple

Prof R F Ruttan writes most interestingly in current Supplement No 1789 on the manufacture of alcohol from sawdust and other wood waste. A nov-type of automatic stamp-rending machine is describe and illustrated Prof Charles Edward Lucke write on the development of power systems. ### The Highest Dam.

At the hour of two in the morning of Sunday, January 16th, the completion of the Shoshone dam in Wyon-ing was announced. This is the highest dam in the l, being 3284 feet from the base to the pe world, being see a root from the base to the paragram. It is located in the profound canyon of the Shoshons River, in one of the wildest and most picturesque regions of northern Wyoming. The walls of the gongs are nearly perpendicular, and rise nearly 2,000 feet above the stream At its base the dam is 70 feet across; or top it is 175 feet in length, and at the base the dam is 108 feet wide

completion of this dam creates an enreservoir, having a surface area of ten square miles and an average depth of seventy feet. The capacity and an average depth of seventy feet 'rne capacity of this irrigation basin in gallons is something like 148,588,512,000. The construction of this great dam was attended with difficulty from the beginning, owing partly to the inarcessible section in which it stands. The dam is to control for all time the great floods of the Shoahone River and to provide an ample water sunby for the tripation of more than 100,000 acres of

supply for the irrigation of more than 100,000 acres of exceptionally fertile land in the valley below, a porti which is now available for settlers under the of the reclamation of

the contract for the Shoshone dam was let Septem ber 18th, 1905, to a Chicago firm for \$515,790 This firm, however defaulted, and the work was completed by another contractor

### Rallette ning Car.

When streets are cleaned by sweepers, whose brushes push the dirt before them, the dirt is sweep into the groove of the street railread rails and thes compacted by the wheels of the running cars. The rails accepted with dirt. Offer a greater resistance to the electric current, thereby causing a greater amount of power to be used for the propelling of the cars. The must be constantly cleaned to avoid loss of curre

The Hanover Street Railway Company has built for is purpose a special rail-cleaning car It is similar this p in construction to a regular two-axis car, and has two 26-hors-power motors Between the front and rear wheels on both sides of the car are steel brushes, which wheels do boild sluwe of the car are steel organes, which coloues the dirt from the rails. This dirt is automatically removed by a vacuum pump, and deposited in a box built into the lower part of the car between the axles of the driving wheels. The vacuum pump is axies of the driving whoels. The vacuum pump is operated by an electric motor attached to the dirt box. To avoid the raising of dust in dry weather, a sprinkler and two tanks, holding about 925 gallons of water each, are provided

As soon as the box is filled, an automatic alarm notifies the motorman who shuts off the pump, reises the brushes, and takes the car to a place where it can be emptied and made ready for another trip

be empired and made ready for another trip. This car can be run at any run of speed allowable in street traffic up to 17% miles per hour, and still in street traffic up to 17% miles per hour, and still man and the assount of poser track it as possible traffic and another traffic traffic and another transport of the traffic and saily as a verage of 46 miles of track, using according to weather conditions, up to track, using according to weather conditions, up to of dirt per mile of track

### Beath of Thomas A. Havendale

The founder of the box toe industry in this country, Mr Thomas A Baxendale, died at Brockton, Mass., on April 1st at the ago of seventy A native of England, Mr Baxendale came to Brockton in 1867 a poor man. The shoe industry was then in its infancy He entered In suce mousely was teen in its immary. He outered one of the large factories and invented the box toe which is now used in nine-tenths of the shoes that are worn. Later, with John Simmons as a partner, he founded the firm of T A. Baxendals & Company. He mivested many machines for producing shoes, most of which are now in common use. He died a wealthy man

### Beath of Thomas B. Joffers

Beath of Thomas B. Jashry.

Mr Thomas B Jeffry, who invented what is known as the clincher posumatic tire, died on April Brd. at Pompell, Italy He was for more than twurth-drey years a partner of the firm of Gormully à Jeffry, makers of blerjees. Registal by birth, he came the country at the age of eighteen, and settled in Chicago. He took an active interest not only in the development of the birgels, but in the automobile as well.

Beath of Funl Thredore storout.

Paul Theodors Stevert died January 11th, 1916, in Dresden. He was a wall-known German manifecturer and inventor. He is best known for an invention to which he applied compressed air for biswing, pissels of gloss of any desired sing.

### WANTED-A RICE MULLING MACRINE

To the Editor of the ECHENTIFIC AMERICAN
Whoever will invent a machine to hull rice, will be
as great a benefactor to the rice farmer and the conas Eli Whitney in the invention of the cotton The farmer often gets 75 cents per hundred or for his raw product, and generally has his crop in ein. the mill for months before he gets this. The mills are huge structures because of the necessity for large grage, but the real mill part of the plant is shoul the same in machinery as a flour mill. The main processes are two, the removal of the hull and the processes are two, the removal of the null and the removal of the polish The former is accomplished by burr stones, but the grain passing from under these is not completely clear of the hull The next process is accomplished by a cylinder of wire cloth containing a revolving core of sheepakin with the wool on, which takes off the remaining hull and the outside of the grain as well. The native French of Louisiana pregrain as well "The native renem of Louisians pre-pare their rice by means of a wooden peatle, which removes the bulls and leaves the polish, the most nutritious part of the grain Usually the mills have an arrangement for coating each grain with parasin, but this is not even an improvement except in ap

Whoever will invent a small machine, say in size whoever will invent a small machino, say in size similar to a farmer's fan mill, that will remove the hull from the grain, will remove the rice crop from the enormous toll now paid the miller, and give a cheap and healthy food to the people as a superior substitute for the present rapidly ascending foodstuffs to which we have been accust There are large investments in the milling of the crop but it ought to be a paying investment with \$9.75 profit between the blanter and the consumer on each 75 cents received by the farmer C. W CAMPBELL

Johnston City, 111

## THE EFFECT OF REFRACTION ON THE TRIANGULATION OF MOUNTAIN SUMMITS

A REPLY TO MISS PKCK'S STATEMENTS IN THE PRESI

To the Editor of the SCIENTIFIC AMERICAN Since the announcement by Mrs F Bullock Work man of the results of the recent scientific and carefully executed measurement of the two summits of Mount ussemman by the professional engin Peru by her from Paris, Miss A. Peck has favored the press with communications, the evident purpose of which is to bolster up her assertions not based on any measurement data as to the height of that mountain by attempting to discredit the figures obtained by triangulation the most accurate method of measuring altitude known To effect this the communications centain a quotation and two statements, one of the atter absurd and self-contradictory in its to brought together as to tend to befor the mind of the prought together as to tend to being the mind of the reader and lead him to infer that in general the re-sults of triangulation of a mountain summit by an expert engineer are likely to be vitiated to an extent

expert engineer are likely to be vilated to an extent of 4,000 feet by refraction. The quotation from Mr. Mumm and the statement attributed to Dr. Collie, the one a publisher and the other a chemist by profession, activer of whom, so far as I know, has ever claimed to be an expert in altitude measurements, merely repeat in general (ergss what is well known to engineers that no method of determining the exact amount of refraction having been yet discovered, the present hoights of cretain high mountains obtained by trianguistion may be somewhat changed, either higher or lower, should such method be discovered in the future. Such change would probably not be great in any case, and in many cases surements, merely repeat in general terms what is would be very slight, varying from nothing to a few feet, for no coefficient of refraction that is likely to be

used would greatly alter the results now obtained Between the recognition of the fact that figures obtained by triangulation may not now be absolutely. though they are essentially, accurate, and the ridi lous statement asserted by Miss Peck to have been made by a nameless friend of a so-called 'former mem-ber of the British Royal Engineers' that he triangu lated the great peak K-2 and obtained a height 4,000 fest greater than that now assigned to it by the Indian Survey, which impossible difference Miss Peck would have the public believe is due to refraction, there is

nave the public objects in the or institution, that an impassable guil.

The possible discovery of an absolutely accurate method of determining refraction would affect chiefly the present attitudes assigned to certain very high Elimalayan peaks, such as Mount Everest, which were triangulated from very distant points low down in the adian plate, and to a less degree some other high halis also measured from distant stations. At the plants and measured from distant stations. At the Alterophich of a paper on mountain copioration read by see before the Rayal Geographical Society in Lon-tic in Newmonte, 1997, Shr Thomas Holdich, one of the many markets, there English engineers, for many years the heavy of India consumed in Hima-

king of the very high layan surveying, speaking of the very highest moun-tains said "We do not know exactly, and at present there is no means of determining, what the exact and the of refraction may be in those altitudes.

result of variation when applied as correction to those observed trigonometrical allitudes may be consider-To show what he judges to be considerable may ded his further remark, "Mount Everest will be add probably prove to be some hundred feet or so higher than we at present reckon it."

Observe that Sir Thomas considers one hundred

feet in 28,003 the present height assigned to Mount Everest, a considerable change in the sittude of that peak which is the most extreme case of all on account of its great altitude, its distance from the measuring of its great attitude, its distance from the measuring stations, and the large amount of moisture in the air above the hot, steamy plain of Bengal He does not for a moment entertain the figure of 4 000 feet said to be suggested by the friend of the British Royal Englineer If Sir Thomas's estimate be a probable one in this case, in the more favorable ones of lower summits measured from near stations the amount of

correction would shade down nearly or quite to zero Now Miss Peck supposes an allowance similar to the friend of the Royal Engineer's 4,000 feet made to the it of Huascaran and asserts, "it is easily happen that the mountain is one or two thou sand feet higher than it has been figured," which would bring it up well toward the altitude she has estimated it at. Such a supposition is not tenable Even if the 4 000 foot statement regarding K 2 were aven it the 400 root statement regarding K2 were true the conditions in this case are entirely different Her plan is ingenious but not creditable to her knowledge of the principles of allitude-measurement. Sup-positions have no place in this field. Observed facts are what count.

M do Larminst and his assistants, who are expert rs and know what they are about triangulate the two summits of Huascaran from four accurately d stations at an altitude of 12500 feet, in the immediate neighborhood of that mountain in perfectly clear weather Here was no immensa distance, no haze in the air no great beight of the summits above his stations, as in the case of the great Himalayan peaks mentioned, to cause any appreciable chance of error due to refraction. Refraction in this case, if not allowed for at all would be practically a negligible quantity. His results determined from four stations. racy, must be exact to within a very small figure Prof Fr Schrader and M Henri Vallot of Paris after a careful personal examination and checking of all M de Larminats observations and calculations have inon Larminata observations and calculations have in-dorsed them as correct. The indorsement of engine ra-of such worldwide reputation as they have is a suffi-cient guarantee of the accuracy of the work. Miss Peck may therefore rest assured that this triangulation will be accepted by engineers and experts as accurate and definitely settling the question of the altitude of the two summits of Husscaran

Miss Peck makes two other statements, the relation of which to the altitude of Huascaran is not apparent That I "improperly claimed" a world record with 23 394 feet, and (2) that Mr Graham's ascent of 23 384 feet, and (2) that Mr Graham's ascent of Mount Kabru, about 24,000 feet, twenty years earlier, is now quite generally acknowledged." Mr Graham on his return from the Eastern Himalaya claimed to have nearly ascended Mount Kabru as well as to have made a number of other high swents. He gave an nt of his experiences, in London His claims were very generally dishelloyed at the time and afterward by mountaineers and engineers, and were especially disputed by the Indian Survey, the members of which disjuted by the Indian Survey, the members of which were in a particularly advantageous position to judge of their truth. The grounds for discrediting his ascent of Kabru were saveral but the strongest of all, well known to the Survey officials, has never, it think, been published as the Survey did not enter the lists in print against Mr Graham Within two years I have had the opportunity of discussing the question with a retired surveyor general of the Indian Survey, who was in Calcutta when Mr Graham returned from his attempt on Kabru, and he expressed his disbelief in the

Some time after the event Mr Douglass Freshfield advocated Mr Graham's claim bringing forward no new evidence beyond Mr Graham's original account. new evidence beyond Mr Granm's original account, but basing his opinion on certain considerations of probability, which though specious were not con-clusive and did not convince the public He stood nearly alone for years Recently a few of his friends have expressed their concurrence in his opinion, and in the United States Mr E S Baich and Miss Peck have echoed the cry, though neither of them can have

have echoed the cry, nough seitzer or tasem can nave any knowledge of the question that can make their opinion regarding it of any value. The world at large has remained either neutral or dishelieving. It is noteworthy that Mr Graham had no .nstru-ments, not even an anevold, with him by which to determine the allitudes he claimed to have reached so that, as in Miss Peck's case his ideas as to his altitudes were based wholly on guesswork. It is also

ant, as an English journal recently stated, that after his account given in London, he never joined in the discussion that followed nor attempted by any further statement to defend his claim. Not long afterward he disappeared, and, so far as I have been to learn, his whereabouts have since remain

Mr Graham's account constitutes the only evider available in the question If anyone after reading this chooses to believe that his claim to have ascended Kabru is valid, he has a perfect right to do so, but such belief does not afford any proof of validity, not does it warrant the person holding it in asserting that Mr Graham's ascent is now quite generally acknowledged. The only verdict that can be reached, as the

atter stands is that of unproven In stating the above facts I wish it distinctly under stood that I am not expressing my own opinion as to Mr Graham's claim This I have nowhere done either in lectures or in writing although such expression has been ascribed to me by others
With regard to Miss Pecks repeated as

I 'Improperly claimed' a world record with 23 34 feet, my position may be stated as follows Although, as a matter of fat, this altitude attained by me in 1983, was and remained for several years the highest measurements. ured altitude reached on an ascent, and although I had ured artitude reached on an ascent, and atthough I had overy right to publish it to the world as a record, with two exceptions I have never mentioned it as such either in public or in print not even in the volume I'ee Bound Heights of the Mustagh," by Mrs Bullock Workman and myself in which I have described my Workman and myself in which I have described my ascent to that allitude One exception was a mention of it in one of the issues of Whos Who? The other was in connection with a paper on that ascent read before the Alpino Club in London th May, 1905 when I said

'The word record' in the title of this paper is us as referring to the highest substantiated ascent yet made in mountaineering. The contention that Mr Orabam reached an altitude of 24 000 feet has on various grounds whether rightly or wrongly been so strongly disputed that it must be regarded as far from proved and therefore the altitude mentioned cannot properly claim a place among those acknowledged to have been made

In this year 1910, so far as Mr Graham's claim is concerned. I see no reason to alter a word of that

In view of the above I do not think it would be in view or the above I do not think it would be courteous in m. to deprive Miss Pick of the distinc-tion of 'improperly claiming' a world record in which she herself has enjoyed a monopoly for the last two years. During that time her chief appeal to the in torest of the public has been not by scientific obsertions on natural phenomena at high altitudes but by constant reiteration in the press without the authority of any measurement proof of claims to the attainment of an altitude variously stated at from 25 000 to 23,000 feet which finally crystallized into 'It may be re garded as certain that Huasaran is above 23 000 feet If, as seems probable the height is 24 000 feet have the honor of breaking the world's record for mer

as well as women

Mrs Bullock Workmans engineers have now
stripped her claim of all its and probabilities and brought it definitely down to 21 812 feet the aititu of the lower summit of Huascaran she claims to have WILLIAM ILL STER WORKMAN

Effect of Rainfall on the Cotton Industry.
The amount of rainfall and the development of the cotton industry in any region are intimately connected. The first proof of this rather supprising assertion is found in the continual endeavor of inventors. to devise means of giving to the air of cotton spinning ms a proper and sufficient degree of humidity. But a deficiency of natural humidity cannot be perfectly remedied by artificial means, and it is a fact well known to all cotton spinners that the product of the known to all cotton spinners that the product of the spindles is considerably increased by the constant presence of a large amount of moisture in the air. The moist climate of Norwandy has made that prov-ince the chief seat of the cotton industry in France, and for a similar reason Manchester has become center of the English cotton manufacture. In addition to a moist atmosphere the cotton industry requires abundance of water in its visible form. Cotton milk are always located on or near streams and are pro-vided with capacious reservoirs

Hence the great diminution in the rainfall of the Manchester district which has taken place within the last half century is a valid cause for alarm Heaketh isst nair century is a value cause for starr reserve has collated the records of rainfall made between 1880 and 1908. He finds that the mean annual rainfall was 36 inches between 1880 and 1886 but only 27 1-3 inches between 1886 and 1908. The observed shifting of one of the branches of the Gulf Stream is suggested estble cause of this great decrease in rainfall which threatens the industrial prosperity of Manches

## THE DISISPECTION OF BAILWAY CARS.

The running of a railroad in Germany is evidently accompanied with unpleasantness, if one may judge accompanied with unpressantness, it the may judge from the accompanying photographs. The Poisdam shops, which are responsible for the proper main tenance of rolling stock, have been confronted with the difficult task of disinfecting the cars. It seems that the ceaches which return from Russia are literally aswarm with termin Even after the cars had been cleaned with true Teutonic thoroughness, there was still the possibility that living disease germs might still the possibility that fiving disease germs injur-lurk in the walls and hangings it was therefore, the practice for some years to take down all the uphol stern curtains etc. and to clean

rything thoroughly Natur ally, the expense involved heavy and the cars were with held from service for a consider-able time Moreover, there was also the danger of infesting the

shops and other cars

The problem seems to have been successfully solved by Julius Pintsch who applied to the rail way car a principle of disinfec-tion which has been successfully employed on vessels. His disinfecting apparatus consists of an iron cylinder hullt up of cast iron annular sections of 16 feet in-ternal diameter. The inside length is about 72 feet. The cylinder is so stoutly constructed that it can easily support without deformation a 30-ton car During disinfection the air

within the cylinder is considerably rarefied by a pump, and as a result, the outer air exercises a pressure of about 1,800 tons on

the disinfecting cylinder Since the apparatus in ed during disinfection allowance has to be ma for expansion Hence the cylinder is mounted upon rollers, so that the apparatus can yield to an extent of about three-quarters of an inch in length, which is amount of expansion

Before it is run into the cylinder, all the windows Before it is run into the cylinder, all the windows and transms of the car are opened By means of a trans a two-ton closure is brought against the opened of the cylinder A rubber gasket is employed to make the closure hermetic. Huge bolts hold the ineace are county negroots ruge polts hold the closure, gasket, and cylinder together Steam is blown into the interior of the cylinder Two hundred and fifty steam pipes line the interior of the cylinder, all receiving their supply from the main pipe total length of all these pipes is about 1% miles In

order to heat the air within the cylinder quickly and uniformly, two blowers are set in so that all the air is brought in contact with the hos Even during the cold her the temperature weather within the cylinder can be raised to 140 deg F in from one to hours in order to heat an entire coach to this temperature, about five hours is required. After the car has reached the proper tem perature, the air is pumped out of the cylinder until a vacuum of 74 centimeters of mercury under the normal pressure is ob-tained. At this atmospheric under the normal pressure is ob-tained. At this atmosphere, pressure water will boil at 104 deg F Hence all moisture is evaporated from the car without ring the parts by the exce heat In no other way is it sible to kill vermin effectually The uphoistery curtains, hang-ings etc., are not in the least in-

For very special purposes the cars may be disinfected with formaldehyde gas At the very first attempt a car was thor-oughly purged of vermin To make assurance doubly sure, and to test the efficacy of this formal

dehyde disinfecting method a glass vessel full of the living insects had been purchased from a professional vermin-exterminator in Berlin This vessel was placed in the car and covered with cotton and linen The insects were all killed

The apparatus has also been employed wet cars as well as cars pervaded with the un-pleasant odor of cooking. After twenty-four hours they were quite ready for service again. In this case no formalin was used

Liniment for Burna.—40 parts sugar lime, 10 parts glycerine, 30 parts carbolic acid oil, 3 parts saiol.

### SOVERHEEST IRRIGATION IN THE VARIES WATER-SHED -THE TIRTON CARTON CANAL BY DAY ALLEN WILLIAM.

The region adjacent to the Yakima River in south ern Washington is the location of a group of irriga-tion projects which are notable for the engineering The topography of the country reveals a number of areas of arid land, separated by hill rang which prevent water being distributed from a single source of supply The ongineers of the Reclamation Service have made an investigation which extended from the lower portion of the Yakima River to its head waters in the foot hills of the Cascades, and

The huge cylinder in which German railway cars are disinfected by steam and formaldehyde at Poissan after their return from a trip to Russia.

have planned five resorvoirs and distributing system which will have a capacity to irrigate no less than 350,000 acres, making this group of projects one of the most important in the West. The various works are the Tieton, Sunnyaide, Wapato, Kettitas, and Benton They have a water supply through the from four lakes and a submerged "meadow" having a total area of 574 square miles. While the lower section of the Yakima River is

used in part for what is known as the Bunnyside project, most of the service is performed by the Tietun, the Naches, and the Coxiche streams—amail rivors which are feeders of the Yakims.

Of the projects, the Ticton is most interesting from scientific stand; oint, owing to the difficulties s the route, the various applications of power, and the fact that without the use of concrete the proje

be impossible to build a tunnel or open canal upon it. Consequently, several miles of the conduit were supported upon hinges or arms of reinforced concrets ported upon hinges or arms of reinforced concrets anohored into the rock and extending outward from the canyon side. The Tieton project contemplates the irrigation of from \$4,000 to \$0,000 acres of land in the vicinity of North Yakima, Wash

As the water is conveyed along the precipitous side hill of the Tieton canyon, for 20 per cent of the dis-tance the canal lies in tunnels. The open canal sec-tions are of semicircular form, 8 feet 2% inches in tunnel sections are of circular form, 6 feet 1% in

or circular form, 6 rest 1% inches in diameter, with concrete shell 4 inches thick This canal and tunnel lining are made up in 2foot lengths, manufactured on the flats along the river bank, where concrete ingredients are readily obtainable, and lifted to the canal line by cable hoists operated electric power These hoists ud by electric power These hoists are used successively at points about two miles apart, and the concrete shapes are transported along the causi between hoists on railroad tracks laid in the bed of this vated route

This plan was adopted for the reason that beds of sand suitable for concrete were found in th bottom of the river. In fact the Tieton valley was made the site of a novel concrete works. The question as to how to transport them to the work was answered by the use of electrical power A series of tramways were built at convenient points up the side of the canyon operated by cable

the canyon operated by cable hoists. These hoists in turn were served by a series of electric motors souring current from a power size tion constructed for the purpose. The concreta as fast as mixed was molded to the proper dissensions in a portable molds mounted on whoch, so that they could be drawn from pisce to piace. After hardening had taken piace, the forms were set upon trucks having sides of steel frantwork. These trucks were mounted on the trainway, and the material hauled to

mounted on the tramway, and the material haused to the top ready to be set in place. On the Tieton project 10,000 feet of tunnel wen-necessary, divided into two services of 3,000 feet each and one of 4,000 feet. In sectivating these much of the formation was found to be of black beautir rock requiring special machinery to ensure it. In making other than the second of the second of the second etc. The second of the second of the second etc. The second of the second of the second all of from 50 to 0 feet per mile, and setvating was taken of

mile, and advantage was taken of this to develop the power re-quired for operating drills and other machinery and for lighting purposes A power canal 3,500 feet long, of 180 second feet maximum capacity and 34 feet effec-tive head, has been completed, which supplies water for operating a Franklin air compres ing a Franklin air compressor capable of compressing 1,260 cubic feet of free air per minute to a pressure of 105 pounds per inch, a Westinghouse generator of 120 kilowatts capacity, and one set of 26-inch twin turbines. About 500 horse-power is developed, ample to operate the six electric drills, six air drills, shop machinery, pumps, hoists, etc and to light all the camp build inm. The turbine is regulated by ings. The turning is reguinted by a governor, and the power canal is provided with an ample automatic overflow, just below the power house. An electric transmission line, carrying 2,200 volta, has been constructed to the upper

portal of Trail Creek tunnel, a distance of seven miles. Electric drills are being operated at the two portals of Trail Creek tunnel, and at the upper portal of Tieton tunnel. At the lower portal of Tieton tunnel, and at both portals of North Fork tunnel, air

drills have been installed.

Another difficulty in the way of building the Tieton

ABOURT officers of the way of building the Trieston project was the crossing of a number of ravines carry-register was the crossing of a number of ravines carry-tics. The control of th

Scaling the cylinder with a two-ten gusketed closure before exhausting the air and turning on the steam.

### THE DISISPECTION OF BAILWAY GARS

would have been impossible. This stream flows through a deep canyon with very steep sides, the height of the bluff ranging in places as high as 400 feet from the bed of the river to the level of the canal The water of the Tieton is diverted by means of a concrete dam thrown across the stream Although of a concrete dam throws seroes the stream. Although but three fort high and 200 feet long, the reservoir hus made is sufficient to fill a main cann 13 miles. In coaveying the water from the dam to the point of distribution, the only practical notes which could be located was imprivationg the side of the coayen near-the top, ther im being of such formation that it weeks to go, the rim being of such formation that it weeks

canyon. The land, however, is especially suited to the raising of forage, fruit, and hope and is located on three important rainroad lines having connections with the principal cities of Washington.

Oliment for Burns.—Indatorm, 80 parts; extract of confi. 40 parts; onrboile acid, 1 part; rece unguest, and parts.

COVERNMENT IRRIGATION IN THE YARINA WATERWED .- THE TISTOR CANYON CANAL. To those of us who served in the Spanish war, and had the canned or corned best served us as a part of the regular ration, the new will not come as a surprise, but the man who reads this will undoubtedly think of the good betwhe get as home and wonder why complaints about he made.

One particular reason why the army will now use carned best is from the point of economy, for as meaning the server of the se

It necessary for the War Department to submit a de-ficiency estimate to Congress. If the present rate of increase keeps up, the cost will be nearly 23 cents by the one of the next factsl year. When it is considered that the army annually consumes several millions of rations, it will be seen that an advance of even a fraction of a cent in a single ration means a big ad-vance in the aggregate for a year.

## NOW GAMBLES CHEAT

Games of chance have always had a fractination for all classes of individuals at all ages, and the profes-sional sharp has made this weakness (which in some persons is developed into a ruling passion) a some persons is greedoped into a runing passion) as means for carding an easy livelhood at the expense of the numerous flats' who visit to keep course or other places where gambling is looked upon as a more or less keltimate pustim. The linguitious mechanical devices which have

ben employed for this purpose are really astonishins. Such clumey appliances as louded dien are, of course out of date though one ingenious sharp invented a table the top of which was sheet steel under a very thin cloth covering. By means of an electro-magnet concealed means or an ejectro-magnet contracts within the table, its top could be converted into a powerful magnet, and the dice (whith were prepared by having one side of metal while the rest were itory) could be attracted to the table when the current was on or would fall in any buzard position when the current was shut off Dice, however are generally suspected and hardly anyone would ven ture to stake money upon the fall of the dice any more than he would upon three card monte

Cards are the most fertile field for the umbler's revenue. Winning at cards depends largely upon the possession certain high cards or the aces which win the tricks and to gain possession of these cards is the gambler's object. For assuring this various devices have been employed called 'holdouts' mechanical ployed called 'holdouts' mechanical trivances concealed in the sleeve which by a very slight pressure or movement in one direction, will instantly shoot out the required card into the gambler's hand and recede again into sleeve One of the most ingenious and perfect of these was invented by a r named Keplinger and the gamoser stance Kepinger and the de-vice has ever since been known as the 'Keplinger holdout' The apparatus was worked by the knees, so that no motion

worked by the anews, so that no motion of the arms or body was necessary A slight separation of the knees was all that was required to shoot the card into the gambler's band. The knees were thereupon relaxed and the "holdout" recoded like a fiash into the sambler's sleave

Another variety of holdout is that concessed in the waistcost, and here the hand is held close to the body with the cards outspread while the thread is pulled, and in that manner a card shot into the hand cover of the remaining cards This however is a dangerous procedure which is rarely employed small but ingenious species of holdout" is that known as "the bag". The small sharp point seen in the illustration is stuck into the wood of the u

side of the table in such a man ner that the flat bar runs along parallel to and just touching the or more cards are now inserted into the clip thus formed, and may be withdrawn by the fingers in the act of drawing cards on the table toward the

A daring yet simple variety of 'holdout' is attached to the sleeve it is buckled around the shirt sleeve under the cost and two small pointed books faring outward press against the coat sleeve These hooks may be separated or brought nearer tagether by pressing upon a small rubber If now a card be pla against the coat sleeve, on the outside, and the clips separated outside, and the clips separated and then released, they will class the edges of the card through the cloth of the cost, and it will be retained there by the pressure of the spring in the "holdout." Bo long as the arm "holdout." Bo long as the arm be held downward, the card is invisible, but the card may be

obtained possession of by the fingers of the other hand when resting against the sleeve of the arm to which the "boldout" is attached

A still simpler device is to have a small pocket out in the coat sleeve at the seam. The "pocket" is merely a slit about three inches long, into which the required card is inserted. The fingers grasp the card and withdraw it with the others at the required moment. Another variety of "holdout" is known as

the 'ring holdout." A ring is worn on one of the fingers, to the inside of which is attached, as part of the ring, a small wire oilp or spring, fiesh colored The card is inserted under this spring, and in that The eard is inserted under this spring, and in that manner is retained within the paim of the hand by the pressure Experts in aleight-of hand would not require a city of this character, being enabled to paim the eard without any mechanical aid.

sides such devices as those just mentioned, the

THE READORATE OUTSIT OF THE GAMBERS.

gambler depends for his success partly upon his dex-terity in handling the cards during the actual progress of the game. Of course marked cards are progress of the game. Of course marked cards are frequently employed for this purpose but the expert gambler will succeed in marking the cards with his thumb nail during the course of the play, so that, at the end of a few hands he knows practically every card in the pack from the slight indications upon its back Bometimes, also cards are bent more or less slightly to insure their recognition—either individual cards or a number of cards together. If half a pack is bent in this manner this is called "the bridge" Kach card in this section then has a slight curve, as

SOME GAMBLERS TRICES WITH CARDS.

THE PARTY OF THE PARTY OF

A gambler may even deal to himself or to any per-son forming the circle a particular eggrd which is known to him. This eard is at the bottom of the pack, and the 'sharp' deals of the cate from the top of the pack rootineously until he reaches the person into whose hand he desires to pince the card over it to him, which, ye a regist movement, he with-drawn, not the top by the bottom card with his Lagaru instead of his, distant. This trick, when

rapidity and wall especified, is practically undetectable.

Clard "sharps" also outpley other devices for galaxing knowledge of the cards dealt to every member in the In order to go circis. In order to gain this movements, a small mirror is employed. Songetimes this mirror is at-tached to a needle point, and fixed to the under side of the table nearest the destr if, now, is dealing, such card be passed over the mirror in turn, the gambler will be enabled to but the position of each card dealt, and to follow the cards before card dealt, and to follow the cards before

a single play can be made. A mirror of this character is a dangerous device, and it is easily detected. For this reason, very ingenious schemes have been em-ployed, A small mirror is inserted into ployed. A small mirror is inserted finic the bowl of a pipe, side carelessly on the table, the bowl being turned slightly upward and toward the dealer. Now, in dealing the cards, they are passed such in turn over the bowl of the plps, and in this manner the magnifying glass it con-tains conveys to the "sakary" all the re-cuired knowledge as to the cards con-tained in each satter's hand. Constituent in "sharps" employ a mirror ring for this which during the course of play, is swung around so that the signet faces the paim instead of the back of the swung around so that the signet faces the paim instead of the back of the hand. The signet then swings open on a pivot hings and discloses a tiny magnifying mirror beneath. By the aid of this mirror, the majority of cards can be detected as dealt At least acres and court cards can be distinguished from cards of lower values, which is the chief there to be discoursed. thing to be discovered

There are a number of other ingenious devices employed by professional sharps, but the above will at least give the reader an idea of the extent to which this practice has been carried, of the re markable ingenuity displayed by ma facturers of such devices, and of the dexterity and daring of the gamblers thomselves in employing them.

Bacrographic Bramination of Motals The macrographic examination nictals consists in examining with the naked eye the surface of the metal, which has been polished and chemically treated in such a manner as to bring out chemically treated in suce a manner as to bring out its constitution and its impurities. In micrographic or microscopic examination the particular objects of study are the character and chemical properties of the alloy, while macrography concerns itself with the physical properties. The principle of the methods used is as old as the first methods of damascening. in which an acid mixture was employed which black ened in different degrees the strips of iron and stor which had been welded together in the formation of

### MIS FIR TREES OF THE MORTHWEST

The fit trees of the Pacific Northwest occasionally attain such proportions, especially in the territory near Puget Sound, that the stumps after the trees have been cut down are employed for novel purposes. In some portions of Washington one can see these bugs of the property of the proposed of the province of the property of the pr stumps, which have been hollowed out and actually made into temporary homes for settlers. To make a stump house, it is only necessary to remove the material from the interior, leaving enough to form walls terms from the interior, sewing enough to form wass of suitable thickness. Then a roof of boards or shin gles is put over the top of the stump, holes are cut for windows and doors, and the dwelling is practically ready for occupation. A number of these stumps have been used by settlers on what are called logged-off. been used by settlers on what are called legged-on lands, until they have been enabled to construct larger and more convenient dwellings. After thesetump home has been vacated, it is turned into a stable for the horses, or sometimes into an inclosure for chickens

or hogs.

Next to the big tree of California, or sequola
as it is termed by the scientists, the fir as
found in Washington and Oregon
has the largest dinnater of any
tree in America, and probably in

the world Some have been cut down which actually measured 15 feet in diameter at the point where the incision was made. As they decay very rapidly after the timber has been removed, usually the in-terior can be hollowed out with little difficulty Sometimes they are used for dancing platforms, is shown in the accompanying illus tration, some being large enough to accommodate four couples. An other custom is to turn the big stumps into playgrounds for the stumps into playgrounds for the children, who reach the top by pieces of word nailed against the sides or by ladders, and a pretty sight which a traveler often sees in the northwest is one of the big stumps turned into a flower bed and covered with the trailing vines.

# How to Repair and Clean Typowriters, av Louis A FLANKING

As every user of a typewriter knows, the platen or roll is the part of the machine that wears out first The constant hammering of the type against the surface of the platen soon makes indentations in it, which in a short time amount to such a degree of roughness that it is impossible to produce good, clean work

discovered that will restore the platen to its original smooth condition no matter how badly it is worn or how long it has been in use The formula and method of using

The formula and method of using the compound are as follows The ideal material for use in repairing platens would be hard rubber, but in the process of vulcanizing, the rubber becomes insoluble to a great rubber becomes insoluble to a great degree in the solvents generally used for making rubber solutions. As a substitute for hard rubber celluloid is recommended The hard variety should be used, which is sold under the name of imitation ivory. This is soluble in acetone, amyl acetate, and various other solvents One of the best solvents

is a mixture of eight ounces of acetone and one ounce of amyl acetate.

In the absence of anything else in the way of cellu-id, any ordinary article made of this substance, as a

loid, any ordinary article made of this substance, as a could, may be used There is a variety of colluioid used in the manufacture of combs which is quite sat-latedory for this purpose. The color also is good with the collusion of the color also is good to the collusion of the color also is good to the collusion of the color also is good to the color and the color and the color and the substance of the color and the color and the finally providend silles, incusorial earth, energy, or other similar substances. About one ounce of power-eners to each eight ocuses of compound is a fair pro-portion. Providend component as the vorbs well for the

The celluloid solution should be made as thick as a very heavy syrup or molasses. In fact, as thick as a very newly ayrup or monamen. In fact, as table as shap be apread with a brain. The heavier it is when jied, the sconer it will dry. It a light colored celluloid is used, it is advisable to add some coloring matter, which may be immibiliate or predicably may or earlies. The desired should be used to give the desired grayish color Remove the platen from the machine The work may be done with the platen in the machine, but great care must be taken to protect the working parts from the dust formed when smoothing up also takes less time to do the work when the platen is

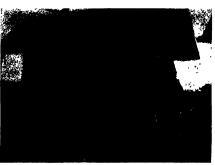

removed
Wash the platen with gasoline to remove all grease
and dirt, and rub it with a piece of fine emery paper,
to gite it a new, clean surface With a brush, paint
the mixture carefully over the platen, giving it a good thick cost

Lay the platen saids for six hours or longer fo composition to harden. Then with a piece of fine emery cloth smooth it down, taking care not to cut quite to the original surface of the platen. This is the delicate part of the work, and upon the care used in doing it depends the quality of the job

coung it depends the quality of the job Actions and amy acctate can be obtained at any drug store. It usually requires from two to five hours for the celluloid to dissolve. Breaking it up into small pleces hastons solution. The solution should be prepared in a wide-mouthed bottle that can be securely

corked it should be shaken often during the process
as this will prevent the colluloid from forming in
lumps The bottle should be kept tightly corked and
away from fire, for it is highly inflammable Should
the mixture become too thick, thin it with a little more celluloid

cellusid
A cheap and simple cleaning compound for type
writers is composed of the following ingredients
Parafin oil 1 pint
Benzol 5 ounces Cresol 1 drachm

Rerosene
Mix thoroughly
This compload was for years a secret confined to
see or two of the large companies that rebuild type
writers. The mechine is immersed in the compound
which quickly and thoroughly dissolves and removes
all dirt, quan, grease etc. It does not injure the
same, but on the routinary improves the appearance
making it as bright as when here. In making up any
desires quantity of this compound results the propor-

ons given in the formula, except that should s quicker drying mixture be desired the quantity of paraffin oil may be reduced and the kerosene increased In all cases the lightest grade of paraffin oil should be used and not the heavier lubricating oils If white paraffin oil is used a water white fluid is produced, if dark paraffin oil is employed the liquid has a light amber color Oil of citronelli or oil of sassafras may amber color our curvacui or on or beneating may be substituted for the cresol which has no action whatever and is used simply to disguise the composition of the compound for the compound for authern the same with it. Place the machine in it and allow it to remain in the fluid for half an hour Bv litting it up and down gum and grease will be washed ing the parts not accessible with the cloth. About t The compound may be used as long as any of it is left as the dirt settles to the bottom of the tub and the clean portion may be drawn off—it is necessary to keep it covered tightly when it is not in use to prevent exaporation of the benzel. A fair preparation may be evaporation of the benzol

made by using one-third the quanformula an equal quantity of kerosene and from one and one-

## The Transformation of Sea Water

Into Fresh Water The belief was prevalent among the savants of the 17th and 18th carthen vessel dipped into the sea, would fill itself with fresh water At the present day it is difficult to say on what this is lief was grout It surely could not have be ιd to it surely could not new over tooked by Cyperine it in a similar sense Marsigli, the founder of occanology made in the year 1725 an experiment which effected filtration of sea water through system of fifteen pots filled washed garden-surth or sand and placed as to let the water fall as if in a cuscude. It is stated that the palate disclosed a definite diminution of the presence of salt Similar assertions are everywhere urrent among semmen A scientific test of the endeavor

to free sait from water was recent ly made by the French investigator Thould His report which appears in the minutes of the Académie des Sciences of Paris states that the presence of sait can be reduced by filtration Forty Cutimeters of the length of a glass tube which was one meter long and was placed in a perpendicular position was filled with seasand and the rest of the tube was filled with scawater por tions of the filtrate were exam at intervals of the experiment to ascertain its density and chemical composition. The result was that in the initial stage of the experi ment density as well as saline con tent were found to be moderately very soon thereafter both recovered their original value arly decrease of value is explain by the mechanical attraction which every chemically meetra; body exer stance in solution as toon as the body comes in contact vith the so

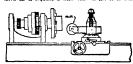

lution in nature too eend falls to effect the separation of sait. Through shipwrecked scamen it became known that relatively fresh water may be found on very low and harren corn! reefs in the Pacific Ocean by digging to a triffing depth in the coral sand. It is not however as was supposed sea water freed from sait through the layers of sand but is simply rain water that is retained by a sand; atratum and by it protected from admixture with the sea water Similar phenomena may be observed on the European coasts. They may be considered the key to the popular belief now contradicted, that sea water can be sweetened by filtration through sand

According to the Electric Railway Journal a novel type of electric locomotive has recently been built for canal haulage near Bromen The locomotive runs on a quay which has to be kept clear for the passage of drays and for other purposes. To secure the increasing weight for adhesion it was divided to build the loco motive in the form of two U's with a connecting girder. The current is taken from overhead wires.

### A TOOL FOR CENTERING WORK IN A LATER HY II D CHAPMAN

The accompanying drawing shows a handy tool for centering work in a lathe chuck When a job is to be faced off it requires a little time to get it to run

## SIMPLE METEOD OF CENTERING WORK IN A LATER.

true The drawing shows how the work can be expedited by the use of a simple tool. The tool is made of tool steel, the roller is hardened. When a job is placed in the chuck to be faced off and the face of the work does not run parallel with the face of chuck the work owe not run appraise with time rate of cruck the roller tool is secured in the tool post, and the lathe carriage is then run up by hand until the roller strikes the face of the job As the work wobbles in the chuck the high position will be struck by the roller and forred true with the face of the laths. After the work forced true with the face of the lathe. After the

and bit of sheet rubber packing, although a piece of an old rubber shoe would last for years

an old rubber show would last for years. You can readly see the application by referring to the sketch. The writer stopped two leaks in steam pipes affects parsa sate by this method. The pipes have been in service ever since and have not leaked. They see both in rather inaccessible places, where it would have been difficult to renow the pipe. At the same time being in out-of theway places the appearance of the patch did not master.

## GROOVED PULLEYS FOR EXPERIMENTAL WORK

Small grooved pulleys or sheaves can of course be turned on the lathe but a substitute for the lathe which in some respects is quicker and cheaper, will be found very advantageous The description of such ethod follows

a method follows in a piece of wood of the thickness desired for the pulley bore a hole of a diameter equal to that of the pulley at the bottom of the V-groove With a half round rasp or large drill countersink this hole on b Split-do not saw-the board in two down the

MOLD FOR CASTING PULLEYS.

middle of the hole, then nail or clamp it tightly to a smooth board the two halves being pressed firmly together. Find the center of the bole with a company and drive in a headless nail taking care to get it vertical, to serve as a "core" for the bearing Have handy a piece of cardboard considerably larger than the pulley, with a hole in its center the size of the nail Pour melted solder into the mold, and quickly

silp the cardboard over the nall and down upon the slip the Cardonard over the ania na urbu upon mind This will force out superfluous metal and make the upper side of the pulley smooth When cool. Incamp the mold and pull apart where split. A knife or rasp will then do all the finishing necessary Two or more pulleys can be cast together by placing the molds one upon the other, with their centure common. The figure shows such a combination. A hub may be made in a similar way if a stronger bearing is wanted, as for an idler, wrap a strip of brass around the nail and lot it become soldered to the metal

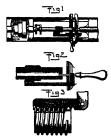

let it become soldered to the metal
Along similar lines a cogwheel may be cast, but
great care is necessary in cutting the tech in the
wooden mold A large number of pulleys can be cast
from one mold, and for duplication work this method will be found guicker than the lathe.

## HOW TO GUT THREADS WITHOUT A SOREW-GUTTING LATRE OR THESAD-URASING TOOL

The ordinary way to cut a thread by hand is to use a thread-chasing tool with the number of teeth per The difficulty in chasing a thread is in inch wanted inch wanted. The difficulty in chasing a thread is in the starting. It takes a great deal of practice, and even then a 'drunken' thread may be the result. The accompaning illustrations show how this can be done in a very simple way and yet give an abso-

lutely true thread

If a number of screws are to be cut the best way to proceed is as follows Take a thin piece of tubing that will just fit over the bar or bolt to be threaded d drill a small hole, into which fasten the end of a spring brass wire, preferably by soldering Then wind the wire around the tube half a dozen or more turns Now take a thread gage Select the number of threads per inch wanted and place it length wise of the tube, bringing one turn of wire in each

SCREW-CUTTING ATTACEMENT FOR LATERS

notch, after which pull the free end of the wire and keep it tight Solder the colls to the tube, using only the corner of the soldering from then move the gage one-third of a turn around the tube and repeat the soldering and finally move the gage again an equal distance and solder

It will now be seen that there is a perfect thread or spiral around the tube, which we will call the master thread. This master thread must be slipped on the bar or bolt to be threaded so that it will not turn, allowing enough room at the end for the threads to be cut. The cutting tool consists of an ordinary hand tool, with only one point. Procure a small piece of wood, long amough to reach over the master thread and to the end of the boit. Into this piece of wood and to the end of the boit. drill a hole just large enough for the cutting tool to

slip through and fit snugly
In operation the cutting tool is held in the right In operation the cutting tool is held in the right hand, in the usual way Then with the left thumb press the piece of wood against the master screw and start up the laths. The master screw will feed the cutting tool the right pitch. As soon as a good start is obtained the tool will feed itself without the aid of the master screw

When the thread is finished the mester screw may when the thread is finished the master serew may be removed and slipped over another bolt to be threaded. The spiral may be wound right or left, according to the direction wanted Any number of threads may thus be formed. That is to say if a triple or quadruple thread is wanted, it is only necessary to wind three or four wires around the master thre and proceed as before described. This arrangement is also very handy in starting a thread when the ordi nary chaser is used, as it will always insure a straight thread. It is not necessary to nick or mark the wooden block, as it readily takes the impression of the thread from the master screw

Fig 1 illustrates a plan view of an ordinary lathe, ready to cut a thread Fig. 2 shows how internal threads may be cut and Fig. 3 shows the master thread.

## STRIPLE METEROS OF PERDING THE CHITER OF A GINGLE.

Very often it is necessary in the drawing room or shop to find the center of a circle, a disk or a p of shafting, etc., when the diameter is not given low are three ways in which this can be done

low are three ways in which this can be done.

The first, Fig. 1, is the method usually used it consists of two right triangles drawn so that their angles are in the circumference of the circle as a be and d e! The point where their hypotenuses intersect is the center of the circle.

The second method is shown in Fig. 2 Draw any chords as 6 and take two points on it as of equidicant from its ends. At those two points erect perpendiculars it comes in the contract products as the contract products are the contract the contract products and the contract products are the contract the contract products are the contract the contract the contract products are the contract the contract the contract products are the contract the contra

made in the ground for the vertical post to turn in is is very useful for pulling wagons and he mud. All one needs is a rope and autos out of the mud. two posts or timbers.

## THE WRIGHTING OF TOOL HANDLES.

How often it occurs that when a tool such as a rad awl or particularly a keen-edged chisel is thrown own in a hurry it will roll off the bench and fall upon the floor, perhaps into a give pot or upon the foot of the workman, or on a hard surface that will nick or dull the cutting edge The following little scheme is dull the cutting edge The following little scheme is employed with all the wood-working tools of the writer and found to answer admirably. Bore a hole in that part of the handle that resist upon the bonch, with a five-slighthe rather dull cutting twist bit. Horse the hole only as far as it he center of the handle, but no farther, or the object desired will be debasted A dull cutting the makes a rough-sided hole fint this pour semmented less (or current the leaf should not be too hol? When the leaf debounds set, trial it off evenly with a fine rasp and finish off with coarse sand paper New when the tool is thrown down hurriedly upon the work bench it will not roll over more than once and will come to rest leaded side down. This little dodge is not only inexpensive, it is thoroughly effective, it will not only save annoyance, it will prevent n accident, which no one can realize more than the man who is handy in the use of wood working tools

READ AWLS WITH HANDLES WEIGHTED TO PREVENT BOLLING.

The illustration shows two brad awls, fitted as described, and used by the writer for several years.

## AN ILLUMINATED GAS REATER.

The accompanying illustrations show how an il-luminated gas heater can be made. The heater is mounted on a suitable pedestal, such as a wrought-iron stand or a base of some old discarded oil lamp The heater proper consists of a burner A, a screen B, and an outside cover or shield C, which is removable.

A suitable handle is provided at the top of the cover

for this purpose

Through the base passes an ordinary gas pipe, and
at its lower end a stop-cock is fitted with a suitable
attachment for a rubber hose so that it can be connect
ed to the gas supply in the usual manner At the upper
and of the gas pipe is attached an adjustable sleeve for regulating the proper proportion of air to be mixed with the gas. The sleeve terminates in the burner proper, which is made with double walls. The lower proper, which is made with double waits. The lower part is made content, so as to better distribute the mixture of gas and air. The burner proper is made from ordinary culluary utenalis, the inside part from a small pan, and the outside part is made from a columner with very small holes, the smaller the better These two parts are riveted together at the top, so as to make them tight. The lower or conical part-may be

times two facts are review organic that allow and may be fastened to the upper part as well as to the lower or gas pipe in made from ordinary black from and may be fastened to the upper part as well as to the lower or gas pipe in the same of the

number of holes at the top should be made for the

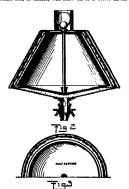

The cover may be cut out or perforated in such a to represent a landscape or any conventional The inside of the shield may be lined with design The inside of the shield may be lined with mics so as to render the heater more safe The mics may be tinted in almost any color desirable. Aniline colors are dissolved in amyl acetate, then mixed with amyl acetate colledion (commonly called banana oil). This mixture is applied with a soft brush and will It will withstand a great deal of

A GAS HEATER IN THE FORM OF A LAMP

heat. When the burner is lighted the gas will burn and form small blue beads on the outside of the por-forated burner, and as the flame strikes the asbestes fibers it will make them glow very brilliantly and change colors as the fibers are moved to and fro by the currents of air passing between the cover and the

If artistically made the heater may be used on the top of a table and will be a real ornament to the house but, of course, will show off to a better advan

SECTIONAL VIEWS SHOWING DETAIL OF CONSTRUCTION.

tage in a dark room. The outside cover is not at all necessary, but is only used to get the desired effect.

## FILES AND THEIR USES.

Nearly overyone who has had much filing to do, knows what a difficult thing it is to get hold of a reliable handle Wood ones will split even if ferruled, reliable handle Wood ones will split even if ferruled, or the brane ferrule will become hattered and weak-ened. Steel ones are rarely satisfactory, and the set stream are simply in the way. The following is a simple method of reinforcing the file handle: At the

end of the file handle turn two %-inch grooves, plac-ing them % inch apart. Connect by two diagonal grooves of the same size, wrap with a piece of paper,

growers of the same size, wrap with a piece of paper, and pour Babbit metal or solder in the top Trim up, and you have an everinating file handle A simple and inexpearate file cleaner is made by hammering either end of a medium or larro sized common wire nail until it is fait. This tapering flat piece is then trimmed off square, with a file, and lided to an even thin edger This cleaner is self adjusting to all files and is far more effective than the expensive wire brushes unasily used

the expensive wire brushes usually used.

Files as nearly everyone knows are made from the
best of tool steel to hold a sharp and strong edgeunder tremendous strain. This steel primarily has to
be capable of being easily worked and, after it is worked of holding the finest temper imaginable. It will be seen therefore that it must necessarily be the best of raw material for the articles enumerated below it must be remembered that files have a very high temper, and therefore in all operations in which this degree of hardness is not essential, the temper should be drawn by heating and cooling down slowly in order to render the steel less brittle in fact, the temper and quality of a good file are instanced by the fact that the writer has seen made and has tried satisfactorily a razor ground from a 10-inch flat mill file on a regular emery wheel and then honed and stropped into shape

Perhaps the first use I ever saw old files put to was a full set of nail sets made from 6-inch triangular files by snapping them off to an even length at five inches and grinding the points down to various sizes required The top ends were rounded of nicely, and the teeth were ground just enough to give a beautiful knurled effect to the set I asked the mechanic who made these tools why he hadn't used rat-tail files and make them round, but he said he just wanted them different from the common run of tools. Some years luter I did have the pleasure of seeing a beautiful set made from round files. Only with these there we left an unground strip between the two ends, to affor a good grip for the fingers

Another splendid set which was evolved out of

by a machinist who had occasion to do a little sure isl jettern making from time to time, was a complete set of little V-shaped gouges and flat chisels and half rounds, all made with curved shanks to reac wise inaccessible places. These were made by forging small files of the requisite cross section into the curve required, and grinding the shank and edge to the tool required, and grinding the shank and edge to the tool clearly dry requisite cross section 1 mean that he always took a flat file to make a flat chied and a wave process of the state of them by suddenly cooling in oil from a therry cell heat, and then tempered them to a medium straw and again cooled them, after which they were given their flant grinding and sharpeding. The tang on the file was just the thing to faster the flushed tool in a firmly ferrivaled handle, and the flow was compiled.

if you want a good heavy center punch, snap off either a rattail or triangular file of the right size to a convenient length, say five inches grind a good long taper on it up to the last % of an inch, and make the taper shorter to give more metal to the point, and there you are

there you are
Sometimes a file will help out a serious difficulty if
it is only used. An occasion arose in with it it was
absolutely necessary to absort of some large spikes in
some built up timbers that had sirrady been placed in
a building it to looked will night impossible unit
thought to sharpes a file to an edge on the blunt end
similar to a cold chief, and by driving this insimilar to a cold chief, and by driving this night
type of the similar to be the strength of the similar to the similar to be similar to

the file several times before they were all cut Perhaps the most common use in which lay are put is to make them into burnishers for sharpening cabinet scraper and kindred tools For these they are simply mounted in a bandle and ground until they are perfectly smooth. Triangular files are the ones commonly used for this purpose. A round file makes as mellicular as lor any purpose A round file makes as mellicular as lor any purpose.

and with scarcely any trouble to transform it res for its new duties as it needs only to be sharpen An amateur desiring to take up brass craft work, and not wanting to pay the exorbitant price generally exacted for an outfit, decided to make one from flies In less than two hours he had made every tool lilu In less than two fours as man many every non-mor-trated in a large assortment, and they were a credit-able-looking outfit, comprehensive enough for any ordi-nary purpose, and included all the customary piercing, deating, tracing, and stippling tools.

984,000
884 1832
In addition to running by train orders
984,510 The first precise of the contract of the contr ting is required to see this signal

hange from danger to clear At all stations a record is kept showing the departing time of every train at this station and at the next station east and west. Supposing a west-bound train to be west. Supposing a west-bound train to be approaching a station semaphore. The telegraph operator, if he has no orders on hand for this train to meet anything at his station, consults his block record, and if the block west is clear he calls up the station west, and obtains permission to let a train in the block lie then pulls his block signal clear and holds it in this position until the train is by, immedi ately reporting it to both block stations d the dispatcher

If a train from any cause has to stop between stations or finds itself on the schedule time of a superior train it has schedule time of a superior train it has to flag, putting down torpedors and send-ing a man with a red flag ahead and bark notwithatanding the knowledge that the telegraph operator will not let another train enter the block until it is clear Now, on double track things are very much simplified, as all trains going in one

much simplified, as all trains going in one direction move on the same track, and only have to take siding to allow a train of higher class to run ahead. This allows the use of automatic electric block signals placed at intervals of about a mile, all signals being on the right hand side of the track which they govern At every one of these signals the joints between the rails are insulated, thus cutting the the rails are insulated, thus cutting the tracks up into blocks between the signals. These signals are so wired that when a train approaches one of them, if the block ahead is clear, the circuit will be com ploted from one rail to the rail on oppo-site side of track through the wheels of the train, causing the signal to come clear, in which position it stands until the engine passes it—if one of these signals fails, the train is required to wait a min ute or two long enough to allow a pre-ceding train to clear the block or to fing, and then proceed with caution to the next

thousand times to one failure, and are so nal at the danger position

ane proper or determining the work ing capacity of the victim of an accident is divided into two parts. It is necessary to establish, first, the condition in which the accident has left the various organs and functions of the body, and secondly, the effects of the consequences of the accident was the effects of the consequences of the acri dent upon the power to work, either at pations as he may be able to carry on Dr imbert in a recent article criticises the methods generally employed for the solution of this problem. The attendant solution of this problem. The attendant only their personal opinions, instead of employing the exact methods of examina tion which are used in physiological laboratories. Thus in many cases, in which the statements of the victim appear false or exaggerated, the truth could easily be the electric exploration of the nerves and physiological study of certain occupa-tions. He thinks that it is possible to arrange a mass of useful data in a form in which they would be available for the decision of individual cases.

That apparently most remote of the sciences from the exactness of physical laws, economics, has been brought under the treatment of mathematics, not only by statistical methods, but by methods of the calculus. The distinguished mathematician and economist Cournet applied to the theory of wealth methods like those in mechanics to treat of equilibria, so that very complicated economic prin-

We have speeded up our ships and railways, we have made rapid transit more and more rapid, we have developed a mile a minute in the air and much faster in an automobile.

But the Bell Telephone is quickest of all. It is instantaneous No weeks or days or minutes wasted in waiting for somebody to go and come, no waiting for an answer.

It is the most effective agency for making minutes more useful, more efficient.

In almost every field of work men are accomplishing more in less time with the Bell Telephone than they could without it. They can talk with more people, nea and far; they can keep the run of more details; they can buy or sell more goods, and to better advantage, they can be active in more

The Bell Telephone has placed a new and higher value upon the minute - for everybody. It has done this by means of One Policy, One System and Universal Service

Bell Long Dutance Telephone service not only gives an added value to a man's minutes—it accomplishes business results which would be absolutely impossible without it. Every Bell Telaphone is the Center of the System.

## TRUE WAY TO PREVENT BAILWAY ACCIDENTS.

i is well understood among railroad officials that the most fruitful cause of railroad accidents it this country is to be found in the lax sense of discipline among the employees Presumptive proof of this is found in the fact that, although our kading railroads have been equipped with a block signal system and other safety appliances, which are generally equal and in some cases superior to those generally equal and in some cases superior to those on European railroads, the number of accidents in proportion to the humber of people carried continues to be larger in this country. We therefore note with much satisfaction that the Chirago and Northwestern Railway has taken a step in the right direction by appointing an official whose chief duties will be to make a study of railway accidents, and by a system of education and strict enforcement of discipline, en deavor to eliminate the most fruitful cause of injuries to passengers and damages to freight Opportunity
was recently taken of the reorganization of the com panys claim department, to relieve the claim agent of much of the detail of his work and allow him to on much or one detail of his work and allow him to make a careful study of the causes of all accidents in the handling of passeogers and freight. It will be his duty to bring about a more thorough co-operation and a higher state of discipline among the various em-ployees, upon whose fulfillment of their duties the safe operation of the trains immediately depend scheme is a most excellent one, and we believe that its results will be so satisfactory as to lead to similar arrangements on at least the more important railroads of the country

## AN EPOCH-MAKING EXPERIMENT.

T the last meeting of the Institution of Naval Architects, a paper was read by the Hon C A Parsons which created a profound impr sion among the British naval architects and stin among the Brittsh hava arenteets and shipbuilders. It was described by Prof J A Ewing of Cambridge University as epoch making", and the announcements which it contained must be considered amouncements write it contained must be considered as second only in importance to those which were mude by Mr Parsons after the successful trial of his first turbine driven steamer. Turbinia .

Mr Parsons apaper which was entitled The Application of the Marine Steam Turbine and Mechanical (identify) to Marine Steam Turbine and Mechanical (identify) to Marine Steam Turbine and Mechanical steamers.

application of a combined steam turbine and reduction gent to a slow speed merchant steamer, the "Vespa-The Vespasian' is a small cargo st less than a thousand tone displacement, which in her original condition was driven by reciprocating engines which were sufficiently up-to-date to be considered as which were summinantly uptrocate to be considered as representative of the average engineersom equipment of the modern tramp steamer. To make certain that the comparison would be trustworthy, and equally favorable both to the reciprocating and the turbine curing the reciprocating engines were thoroughly exchanged and put in first-class condition. The ship overhoused and put in first-less condition. The ship was then taken to sea and put through a course of tricks in which complete data relating to draft weather water and coal consumption etc, were colletted. The vesse i was then returned to the yard the recuprocating engines were removed and a fast-run ning steam turbine with a 1 to 40 reduction goar was installed, the propeller used with the reciprocating engine being left untouched. The reduction goar conon on the high-pressure and low press turbing shafts and a large sour wheel on the propeller shaft The gears were of cast iron and the whole was mounted in plain bearings without the use of any special adjustment devices. The "Vespasian" was then taken to sea, and put through a similar course of

trials to those which were run with the reciprocating engines Except for the substitution of turbines for reciprocating engines, the ship with respect to dust, botlers, and propeller was in exactly the same condi

tion as in the first trials.

When the results came to be worked up, it was found that with seventy revolutions of the propthere was a net gain of from 15 to 16 per cent when steam for all purposes was considered, and of from 18

to 19 per cent for the propelling engines alone Translated into terms of boiler power, this means that one boiler out of every six in the slow cargo boat can be dispensed with

Bleaking of the important question of the strength

of the mechanical gearing Mr Parsons stated that as the 'Vespasian had been taken out in a heavy sea without experiencing any trouble with the red without experienting any trouble with the reduction goar, it was probable that the gear would stand any-bing that the shaft would stand in the discussion of the paper various shipbuilders referred to the long-standing prejudice against mechanical gearing, and it was the general opinion that its rapid wear was due was the general opinion that its rapid wear was due to the imperfections of manufacture which character ized machine work in the early days of the steamship, when goaring was used for speeding up the propeller just as to-day it is being used for speeding down the early mechanical gearing, moreover, because of its imperfection, was very noisy, but it was agreed that the almost perfect gear cutting which can be done to-day will practically eliminate the noise, particularly if the gear be suitably inclosed and sound-deadened

Westinghouse recently proved, in the remark able tests with a 6,000-horse power reduction gear which were carried out at the Pittsburg shops, that by the use of helical gearing, which is the type that was used on the 'Veapasian,' it is possible to transmit large horse-powers with an inappreciable amount of ear and with an efficiency of over 98 per cent, which is about the same efficiency as was secured by Mr

Now the vast importance of these 'Vespe will be appreciated, when we bear in mind that about two-thirds of the steam merchant marine of the world is of the slow cargo-carrying type, for which the steam turbine, because of its high speed of revolution, has been found to be unsuitable. Moreover, the 'Vespawas the first vessel to be fitted with the and it is reasonable to conclude that with its further application to cargo steamers, an average economy of at least 20 per cent will be guaranteed on the engine and 17 per cent on engine and auxiliaries, rof Ewing put it, there will be a saving of one

boiler in six on the whole equipment.
Furthermore, not only will there be economy at the coal pile but the reduction in weights will make possible a considerable increase in the cargo-carrying capacity in this connection, it should be noted that the United States Navy Department has authorized th installation of Westinghouse turbines with Melville and McAlpine gears in the new fleet collier No. 8, which is being built at Sparrows Point, Maryland The space and weight saved by the use of this apparatus as compared with the reciprocating engines originally contemplated for this vessel, will enable it to carry about 200 tons more coal, and it is belie that the economy in coal consumption will be such that the saving thereby effected will add another 200 tons to the net carrying capacity of the collier

### WATERWAY DEVELOPMENT IN RUROPE AND THE UNITED STATES,

E note that a contemporary sounds a word of warning against precipitate action in the wholesale development of the waterways of the United States, by drawing attention to a document issued by the British Roya attention to a document issued by the liftten Royal Commission on canals and waterways, which it con siders to be worthy of serious study on this side of the Atlantic The report deals with the waterways ct Beigium, France Germany, and Holland, and our contemporary advises that it be studied in connection with the recent report of the army engineers on the proposed 14-foot waterway from the Lakes to the Gulf It is claimed that the Royal Commission report strongly sustains the contention of the army engineers that the Mississippi and its tributaries, with 14 900 miles of navigable waters as developed and ed by the government, furnish as good an d waterway system as any in Europe

In France the waterways that are used considerably include a total of about 7,500 miles of rivers and canais, and of this 1,306 miles of rivers and 1,671 miles of canals have been deepened to a minimum depth of 6 6 and to a maximum depth of 8,5 feet, the bulk of the traffic being carried on water varying from 5 feet in depth down to 15 feet.

ermany there are 8,500 miles of wat depth of which in the rivers varies from 5 to 6 feet, while on the lower sections of the larger rivers the depth becomes from 8 to 10 feet. The depths of the alized rivers are from 2.6 to 75 feet, and of

most common Comparing these figures with those of the Minnishpp, we find that, even in the four-water season, boase of 55 to 30 feet farth may be sent from the Guil of Mentios 270 miles to New Orleans, Batton Grups, and Bayru Sara. Boats of 8-60s draft may travel 840 miles farther to Caire, those of 8-foot frant from the Sarah S tance of 365 miles to Chicago The Ohio has a depth of 9 feet from Cairo to Pittsburg, a distance of 1 000

Now, since the Mississippi and its tributaries a Now, since the Mississippi and its irributance soft-ially constitute a better waterway system than any in Europe, the question is asked, Wby is the river and canal tradic in Europe growing faster than the rult-road traffic, while in the United States rullroad tradic is rapidly increasing, and river and canal traffic fulling off One important reason is that both the musicipal and private interests in Europe have provided the waterways with good terminals, and boats and barges have been developed which are specially adapted to river and canal traffic. Here, practically nothing of the kind has been done

As an offset to these conditions, the advocates of larger waterway development are in favor of the construction of much deeper waterways than any Europe, deep enough to allow lake and ocean-go vessels to pass through When the government investi-gated this subject for the State of New York, the con-clusion was reached that the cost of transporting grain by the typical lake freighter on a deep-water canal would be 38 per cent greater than by a towboat and barges on a barge canal, and it was this conclu-sion that led the State of New York to abandon the idea of a 20-foot canal
Our contemporary is of the opinion that it would be

the very height of folly for the government of the United States, under present transportation and com-mercial conditions to spend hundreds of millions on the development of inland waterways believing that the only way by which considerable commerce could be diverted to the present or proposed waterways would be to compel the competing railroads to raise existing rates on low-grade commodities and refrain from making reductions. In France the govern ent compels the railways to keep their rates at i 20 per cent higher than the rates on the competing 29 per cent nigher than the rates on the competing waterways, this practice according to the report of the Royal Commission, being based on the opinion that waterways, because of the longer duration of transport, are not able to compete at equal rates with the railroads

## OSMOTIC PRESSURE AND CURRENTS.

is known that a current can be generated by forcing a liquid through a porous disphrasm or filter, but such currents were too small to be of practical value. The matter has been taken up by a German scientist B Schwerin He claims to have obtained remarkable results in current produchave obtained remarkable results in current produc-tion. A liquid circulates in a tube of large diameter and at a high pressure. Inside the tube is placed a filter through which the liquid passes, constituting of a certain thickness of a proses substance contained be-tween two sheets of wire gause. The current is faten from each of the absets by a wire. To produce a cor-rent we must have the proper liquid and the filter must be specially made. Adding suitable sails to water we find a bird value for the current. At the must be specially made. Adding suitable salts to water we find a high value for the current. At the water we find a high value for the current At the same time the daphragm must be made of matter in an impalpable powder to be effective, so as to reduce the size of the porce As an example he uses a pres-sure of 5 atmospheres for the liquid, and a layer of floody powdered carbon V, inch thick with a surface of 32 quare inches, the internal resistance beling 1000 ohns when datifiled water is used But a small current is now produced, but when we add ammonia to the water the current is increased ten times and the electromotive force twice, therefore we have 20 times the energy by using ammonia. The best results are given by fine quarts powder and the use of a much higher pressure At 80 atmospheres we have as high as 32 volts and 0 8 ampere, or 2,6 watts, which as nign as az voits and 0 5 ampers, or 1.6 watts, which is a very good result. The energy seems to vary as the square of the pressure, and at higher pressures we could obtain large currents. When the pores are finer the flow is issuessed, but the energy is about the same. The liquid is best sent in a closed circuit of relate.

## MALLEY'S COMET

HE first observations of the comet in the morn-ing sky show that it is disappointingly faint. Its intrinsic light has evidently not increased as rapidly as in the even of none other com-ets. Unless there is a change in this respect, it will be far from conspicuous to the saked eye until the lat-ter part of May, said those who wish to see it in the morning sky will do well to use field gissess, and to look for a much fainter object, with far less of a tall than our front sage Riestration of last week showed

### ELECTRICITY.

Russia is becoming interested in hydroelectric power plants, and is examining into the matter of electrifying suburban divisions of its sizer railroads An investigation is being made of our high tonsion transmission systems, and it is probable that a new field will be opposed for American engineers

As alsocial lighting plant in Nobraska is manufacturing ion as a byproduct The exhaust steam of the plant, which would otherwise go to waste is utilized in the ammonia sheorytoin process of ice manufacture and also for distilling water from which the ice is made This venture, we are informed, has proved a very profitable one for the lighting company, and might be cycled to advantage by other plants similarly might be exploit to advantage by other plants similarly

A new system of treating eggs so as to prevent them from growing state when in cold storage has been discovered in Rochester This consists in subjecting the eggs to an electrical current. The theory is that eggs when piaced in storage are allve and are gradually freeze to death, whereas if the life is attrough by an electrical current before they are placed in storage they do not taste state, even when kept on ice for a long period of time

In an address recently made by Prof John W White head of Johns Hopkins Ultervetty it was pointed out that out of the 230,000 miles of railroad in this coun try, only a thousand miles have any rich seen else trified. He called attention to the fact that the elserification of the elserated railroads in New York resulted in in restaing the especiely of the reads fitty per cent. To be and freight service require; such substant, rich pan and freight service require; such per cent. To be Prof. Whilehead shows that in each case electrification to possible and often preferable.

Tangetse dissesses are commonly made by mitting the metal in a panel that is then extrained in the form of a financial after which the parts is expelled and the particles of metal are solved together by an electric current. This compilerated method of form tog the financial side to the fact that tungston is not sufficiently durifle to be drawn out into fine financial and English concern has just discovered a nucleoid of producing drawn filaments of tungston and the General Bieterit Company has also just amounted the discovery of a method by which tungston may be readered sufficiently durifle to praint of its being drawn into fine wires. The drawn tungston filaments at temper than the filament made by the "shuff continued in the stronger than the filament made by the "shuff continued in the stronger than the filament made by the "shuff continued in the stronger than the filament made by the "shuff continued in the stronger than the filament made by the "shuff continued in the stronger than the filament made by the "shuff continued in the stronger than the filament made by the "shuff continued in the stronger than the filament made by the "shuff continued in the stronger than the shuff continued to the shuff continued in th

The Junior Wireless Club is making a strong press aming to restrict amainst work in wireless telegraphy Particularly oblectionable to them is the proposed annual fee of \$100, to be exacted from all wireless stations. As there are between \$4,000 and \$6,000 hope in the country with their own wireless equipment this virtually proposents a tax of between four and five million dollars. Of course, very few boys could be yet a \$100 fee, and the result would be that practically all amasteurs would be eliminated from wireless experimentation it does not seem as though this would be advisable, because many of the improvements in wireless telegraphy have been the work of months in wireless telegraphy have been the work of

Explosions are often caused in four mills and brevele by nails or other iron partities that find their way in the grain, and which when they atrike the steel rolls of the mills produce sparks and ignite the finely pulverized material about them. Revenity along mainting concern that had been troubled by many such explosions installed a set of electromagnets over which the grain is passed befrom 8-bing prepared for shipment to the brewerfee. All iron particles in the grain are thus picked up by the magnets and 800 to 1,000 bushels of grain are elemend per hour. When the magnets have collected a large amount of metal, and the grain are thus selected by the second of any particles afthering to them by residual magnetism. Since the installation of these magnets, there have been no explosions in the mills.

A series of tests was recently conducted for the Board of Zelicottlen of Newark to determine the best form of lighting for schoolrooms. The rooms in which the experiments were tried measured 33 yr 34 cell and were 12 feet high. Three systems were tried, consisting of testly two 15-candispower lamps, and fro-fe-antilepower graphitized filament lamps, and fro-ded tigs. The tungsten lamps were the most commical and gave by far the best light at each else, as was detarmined by illuminometer readings. A similar investigation has been made in Roston, where it are suggested that the room be lighted by lamps placed dampt the side valls just cander the celling in boose with prismatic gians bottoms, which would cast the rays into the room at the desired angle.

### SCIENCE

According to the Journal So. Chem, it has been shown that small quantities of blamuth exert little or no influence on the chemical relation of copper and nitric acid.

At a recent meeting of the Royal Society of Medicine in London, a warning was sounded against the revices use of radium. Even the reputed favorable effect of radium in the treatment of cancer were sharply criti-

The Seine is the fourth largest river in France ranking in size below the Loire, th. Rhone, and the Garonne Its drainage heatin (30,370 square miles) is larger than that of the Suzquehanna (27,400 square miles) or the Saramento (27,100 square miles) or of the Saramento (27,100 square miles).

Sir John Murray, K Cli the well known naturalist, will had an expedition for biological and physilogical exploration in the North Atlantic Although much has been done in this region an enormous field a still unexplored Sir John satiled from Pyrmouth on the 14th The nea will be explored to the depth of 1.800 feet.

B is said that Prof. Karl Harries of the Luivestily of kiel has produced a synthetic rubber. The actual details of the precess are not before us. Attempts and as these have been made gastin and again to the third with the commercial sucress. The most that can be said for them is that they indicate the possibility producing a synthetic rubber from turpentine at some future time.

Dr Robbing, an Emplish writer, calls attention to the development of the jaws of Profilm have who the British have been provided by the protinct british have been provided by the important notable improvement in them next to tust up refer stature and breatity appearance was the total change in the shape and expression of their faces. On analyzing this, one finds that it was to be made away to the provided by the increased growth and improved angle of the lower jaw. The change is due to the rations of hard task and 'soit junk' upon which the included substated

### PROPELLER BRONZE THE EROSION OF

ONE EFFECT OF THE HIGH SPEED TURBINE

The introduction of high-speed turbine engines has produced a serious amount of crosion in propellers made of high tension bronzo—a material which until recently showed no serious erosion effects. The tr ble which the bronze manufacturer has been chiefly occupied in preventing was corrosion both chemical and galvante but crosion or the mechanical breaking and gavarant out crission or the increanited Dreating up of the material by the action of the water, was formerly in wer considered. One of the most nationals, cases of sower e-resident occurred in the case of the Cunard liner 'Mauretania', for after she had been in service about three months, on drydecking the ship it was found that all the bronne propellers. the ship it was found that all the bronse propelless were badly eaten away, those at the storn being best affected. The area that nuffered most was situated about two feet from the root and loward the after edge of the blade. The corrected area amounted to three or four square feet, and the metal had been ready away in depths which varied from a quarter of an inch to two and a half inches. A very therought examination of the problem was

made by Dr Oswald Silberrad who, after an exhaus-tive series of laboratory and other experiments, detertire series or intoratory and other experiments, determined that the deterioration was due to croston, and found that it could be prevented by the use of a special bronze siley whose chemical and physical properties were designed specially to meet the con-

dition
Dr Silberrad came to the conclusion that since the
material withstood the old conditions of propeller
service, the primary cause of the descriptancy as
due to the modified conditions of higher propeller
speed, etc. In discussing the new conditions because the
statement, first, to the terrife surface friction of the
water The "Mauretania" was originally fittor
the four three-bladed, built-up propellers, of the usual
high tension brones that has been employed form any
years for the propellers of Atlantic lines: They were
all title less than 17 feet in diameter, and your the a little less than 17 feet in diameter and pron the stward voyage the average revolutions of the en westward vorsee the sverage revolutions of the on spines were 118, the home-power developed being about \$2,000. The perimeter of each propoler traveled through the water in a helical peth at a garde of about 105 miles per hour, and framemitted to the water dur-ing the whole of the vorsee no isses than 17,000 home-power. "The consideration of these figures," says Dr Silbertrad, "monthless us to results (Ital, under such Silbertrad, "monthless us to results (Ital, under such conditions, the water becomes a very rough file for any alloy to withstand, and when the standard bronze, which has proved so serviceable in the past was sub-jected to these conditions, we can scarcely be surprised that it failed

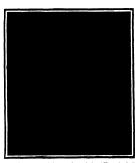

prised that it failed.

A curious feature in the problem was the wide and marked divergencies in the degree and position of the deterioration in the various propellers examined. Thus in the sister ship 'Lusitania,' where the condiraus in the sister sally Lissiania," where the condi-tions were at first apparently identical, the backs of the propellers were quite as much affected as the faces Moreover, the propellers of certain destroyers showed a maximum damage at the base (see illus-tration) where the helical velocity is issait. In look-ing for secondary causes, "dirt in the castings" was excluded because the eroded castings proved to be exceptionally free from dirt, "galvanic action" also was shut out by the fact that analysis showed that no large concentration of copper had occurred on the eroded surface. At the same time the areas of n mum deterioration do not coincide with the view that recusion is alone the primary cause, since these areas in no case occur at the extreme tips of the blades, where the helical velority is greatest.

After a prolonged research, involving the examina-tion of a large number of cases of propeller detario-

tion or a sarge number of cases of propeller determination, it was proved that the trouble was primarily erosion, although the degree to which secondary causes entered into the problem varied more widely then near which property. than was anticipated

a series of tests to determine the relative resis

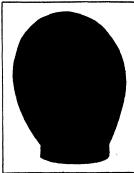

One of the new solid propellers of the "Mauretania" of special turbine alloy, which fall to show any erosion.

tance to createn of a large number of different alloys it was found that the number of hours necessary to produce a certain deterioration varied from 24.700 hours, the time of the regular standard bronne, to 117,200 hours for Parsons new turbing alloy, which was used to cast the new four-bladed, solid propellers with which the "Mauretania" and "Lusitania" have wine when the "Mauretania" and "Lustiania" have been equipped. An examination of these propellers, each of which weighs about twenty tons, was made after they had been running for nearly six months, by the surveyor for Gormanischer Lloyd, who reported that he found them in perfect condition. It is sigint, also, that since their adoption for th ward, or wing shafts each of these ships added about As the same four-bladed propellers are to be fitted to the other two antern shafts it is likely that the transmitantic speed may be raised this summer above the 20.06 average at which it now stands.

20 was in 1850 that Mr. Hind read a paper before the Royal Astronomical Bootet in which he trased this proportions of Robinson analysis of the State It was in 1850 that Mr. Hind read a paper before th account of another counts in 1264 was so contradictory that he had no hesitation whatever in preferring the Chinese statement for 1201, and concluded that the count of 1201 was Halley's. He believed that the precomer or 1891 was rightly. He officered that the pre-ording return of the comet was in 1233, when, in July, shortly before the death of Philip Augustus, a comet was seen for eight days in the evening twilight. The was seen for eight days in the evening twinger. The Chinese annals do not mention this comet, but they mention comets in the years 1223 and 1224, neither of which Hind thought closely resembled Halley's Comet, Cowell and Crommelin have shown that Hisd was Cowell and Crommellin days shows that was wrong about the particularly bright comet of 1223, which was unquestionably Halloy's Comet. Not all of Hind's "ascriptions," as art critics say, are reconcilable with Cowell and Crommelin's latest calculations. casers with Owen and Crommelin's agent chicul-tions, but enough is established on all hands to prove that Halley's Comet has been appearing over since the history of the skies has been written

A new type of locomotive designed to meture smoke less combustion of bituminous coal has recently been tried on two or three of the railways entering Chicago. tried on two or three of the railways entering Chicagon. The apparation is designed to operate or the colling principle. The coal is so fed as to admit of the gasse being first consumed, the resulting coke being figd to the grates and consumed without the black smoke of more rapid and incomplete combustion. Within the first-box is a magazine which may be changed in quastity, a ton at a time if desired, from which the coal is automatically fed to the first. A rotary has measured that the first-box forced on the coal is automatically fed to the first. A rotary has measured that the coal is automatically fed to the first. seed oil, and such substances as burnt sugar Cayenn pepper, accile either, taunin, crude cream of tartar,

nd French plum juice are frequently imported into brandy and whisky

The term 'adulteration' when applied to food or drugs is broad in its scope, but has been given a defined legal meaning. In general it may be said that adulteration consists in injuriously subtracting from a substance any part of its natural or inherent quality or adding to it any ingredient which would render article of a different nature than that of its express nd natural form

Almost coexistent with the growth of this wonder Almost coexisten with the greats of this wonder-ful country, and seemingly as a part of the fierce bust ness competition which has insidiously developed, this evil of food and drug adultoration has arisen. The conditions of substitution and adulteration of foods and drugs were little short of deplorable less than a dicade ago For seventeen long years the bill which has now become the Pure Food Law lay at the door of than now become the Ture root law my at the door or Congress and during all that time it was bitterly op-posed by the manufacturers who had so long enloyed unmotested their privilege of supplying the dinner tables of the nation with impure foods misleadingly

While this act has done much good, there is still a very considerable amount of adulteration practised Pepper adulteration is still remarkably common and "Pure White Clover Honey is concocted by the imitators of the busy bee from gluose Other enterpris rations of the ones peer from guttone Other enterpris-ting manufacturers will cause two grains of Cayenne pepper to grow where only one grew before by making one of the grains grow out of sawdust Ground peas and beans may be found in black proper, and colory seed may be adulterated with forty per cent of pow

In order to run down one class of feed faking, the In order to run down one class of feed faking, the pure-food experts at Washington have introduced the raicroscope into their work. It can be readily under stood how gross adulteration may be detected by a sim-ple microscope, as for instance when for ign seeds gravel, or powdered rock have been mixed with whole es. The adulterant may be of such a char acter as to escape the notice of the ordinary buyer though with even a small lens or reading glass the for eign substance may be seen to be very different from

ilness of the simple magnific food and drug materials, however is of little value for the examination of products which are made up of small particles such as flour, ground spices and pow dered drugs In such cases recourse must be had to the compound microscope with a magnifying power ranging from fifty to four hundred diameters

The world's supply of stark comes for the most part from a limited number of plants, twelve or fifteen early all that are of much commercial im To the naked cyc these starches all appear as a fine white powder, but under a microscope grains or granules are seen which vary more or less in shape, size rings nucleus and action toward polarized light Bome of the grains are almost spherical, others are old and still others are very irregular in in diameter they vary from one-tenth to one-bith of a millimeter. In no variety are all the starch grains of one size, but usually there are fairly well-defined limits. The way in which they sometimes vary will be seen by reference to the photographs re-produced in this article. Most of the grains show, more or less clearly fine lines of rings upon the surface. In some varieties these are arran

"A hilum (nucleus) whose form and position varies widely in certain species commonly occurs in starches," says B J lioward, who has charge of this microscopi work in the Bureau of Chemistry at Washingto "In some it is at the center as in corn and wheat starches, in others near one end, as in potato and ar-rowrout When viewed in polarized light starches show more or less strongly a cross with the bars pass-ing through the hilum. Wheat starch has a central ing through the hilum. Wheat starch has a central cross while in maranta it is occurric and well defined Bean starch which illustrates the leguminous type, has a spindle-shaped cross. In the oat a number of starch granules are joined together forming a mass when these masses of starth are examined under po-larized light individual grains in the mass have their own individual effect, and interfere so with each other that there results little more than a hazy glow of

By becoming familiar with these characteristics it is possible to identify with considerable accuracy nearly all of the commercial starches. Potato starch adulterated with corn starch wheat with corn flour, and buckwhoat with wheat are examples of those most easily detected. One of our photographs shows a picture of points starch adulterated with a consider-able amount of corn starch. The grains of the latter are easily distinguished by their angular form

are easily distinguished by their angular torm.

Another interesting application of the microscopic
method of food analysis is found in the examination
of spices. Many of these naturally vary so widely as
to ash, fiber, etc., and in taste that it is impossible to

## Scientific American

identify certain kinds of adulteration by chemical and identify certain arose or souteration by chemical and physical means alone. A study of the structure of pure samples will usually fit the analyst to detact adultera-tion in the ground spices as well as to identify the adulterant used in order to work most intelligently, however it is importative that the analyst should have however it is imperative that the analyst should have a good foundation in histological botany, since in this class of products the plant cell in its various modifica-tions becomes the means of identification. In an exam-ination of this sort nearly all kinds of plant tissue are mation or this sort nearly all kinds of plant times are to be considered, because some spices are derived from roots, as ginger, some from barks, as cassis and cinna-mon, some from flowers, as cloves, some from seeds, as mustard, some from fruits, as red peoper, black peop-per, etc., and some, such as sago and thyme, from

"Unfortunately," says Mr Howard, "most of the substitutions used for adulteration have a structure very different from the genuine spices For example, ugh pepper may be adulterated with ground peas or beans, it may not always be detected by che means, especially when olive pits or pepper shells have been added to counteract excessive starch present in beans. A microscopical examination will reveal ich adulteration at once by showing the p the large starch grains characteristic of certain legumes. In pepper the starch is present in angular masses made up of small grains."

It sometimes occurs that a manufacturer has added so large an amount of corn meal or foreign grou shells and fruit atones to a pepper as to make the adultaration apparent to the taste by the lack of pungeary, which is often corrected by adding a small amount of Cayenne pepper A sophistication of this kind can be readily detected by the microscopic method kind can be readily addrected by the microscopic method of analysis, because the tissues added are so distinctly different from normal pepper tissue. In one of our photographs is shown the microscopic appearance of a sample of pepper which was grossly adulterated with ground citive stones. The starchy material has been stained black in the picture, while the partly clear por tions, more or less oblong in form, are the stone cells of the olive pits

The capsicum fruits are readily identified by mes of certain cells found on the inner portion of the peri-carp (pod) and others on the seed coats. These cells have characteristic sinuous outlines which make them to detect even when present in very numbers.

In coffee and chocolate preparations roasted chicory cereals, and peas in the case of the former and starchy materials and cocoa shells in the case of the latter, are sometimes used for adulteration Coffee, being are sometimes used for adulteration Coffee, being the seed of a plant has a structure which is very dif-ferent from chlory, which has not. The cell walls of coffee have a characteristic boaded appearance which has present in but few other seeds. Even after roasting and grinding these beads can be easily distinguished while oblerary constains. while chicary contains can vessels by which it can be

cocoa plant, to which foreign starches are sometimes added. Cocoa beans content amount of starch The grains are small in size and are easily distinguished from the starchy adulterants, such as corn and wheat flours or potato corn, and ar rowroot starches. An artificial chocolate coating has

rowroot starches An artificial checolate coatting has been examined which was composed of cooca shells, corn starch, beef tailow and some mineral matter, probably used as a coloring substance.

In the production of artificial julies jams, and some kinds of confections various thickeners are used among which might be mentioned gelatin, starch, agaragar gum tragacanth, and gum arabic. Some of these are difficult of identification, while others can readily detected. Agar-agar is a product made from cer tain seaweeds, and usually contains the siliceous shells tain seaveds, and usually contains the silicrous shelin of ristams. These shells are characteristic and quite distance the shell are characteristic and quite after the tail of the shell o

Starrh can easily be detected by microchemical and microscopical tests. Gum tragacanth and some other gums of this class contain a certain amount of small starch grains. When allowed to swell in water, a delicate laminated structure is developed by which these gums are disclosed even in such products as ice cream and marmalades.

A sample of thickener for cream composed of corn starch and powdered gum tragacanth is shown herein, and illustrates this feature quite satisfactorily In this case the corn starch is shown plainly as the angular particles, while the stringed bodies near the center of particles, while the striated bodies near the center of the field are sweller regression of the gum. The microscope is also of service in the examination of certain odible fats. Thus, if pure land is dissolved in other and the latter is allowed to evaporate slowly under proper conditions, crystals of the land will be foresed. These, if normal, will appear under the microscope as narrow plates with chiled-langued engla. Best latt

treated in a similar measurer will normally orystalties out in sheaf-like turus of crystals, the ends of which

Arms at 1970.

Another app cation of microscopic analysis is in the Absolute application or microscopic inturings in mid-dientification of the flower from which honey is made. This is of practical value in the analysis of honeys purporting to be from certain flowers. Although bees will almost invariably gather honey from several kinds of flowers, sometimes one or another of these predom-nate to such an extent as to impart a distinctive color and taste, enough to allow the honey to be called by that name By microscopic examination it is readily and taste, enough to allow the honey to existe my that name By microscopic examination it is readily assortained whether a so-called apple-blossom honey or an orange-blossom honey is really largely derived from the source claimed A photograph showing sereral kinds of pollen found in an ordinary sample of ney is reproduced

### THE INVENTION OF THE PLAYER-PLANO. To the Editor of the SCIENTIFIC AMERICAN

must file a demurrer to an impression the illustrated article which appeared in your issue of the 9th inst., under the heading "Ringing Chimes by Perforated Music Sheeta." In referring to John McTammany as one of the inventors of the player piano, I think an erroneous impression is thu veyed regarding McTammany's true relation to the development of the player As a matter of fact, he is known and conceded to be

As a matter of fact, no is known and concesses we the father of the player by everyone in the plann trade familiar with the player history, and his claims to its inventor-ship stand unchallenged up to this moment. We do not refer to McCormick as one of the inventors of the reaper or to Howe as one of the inventors of the sewing machine nor to Cristofori as one of the inventors of the plane, although other men besides those mentioned contributed greatly to the development and improvement of the aforesaid inventions.

The history of every great invention has demon-strated that some one man has stood out pre-eminently from all his fellows in the course of its development, and the player has been no exception, and the one man who above all others stands forth pre-eminent in the player field is John McTammany, while around and about him, like so many satellites, have stood other men who have contributed of their genius to develop and improve the invention. In the case of the reaper was McCormick who overshadowed all his co it was McCormick who overshadowed all his contem poraries, on the other hand Howe was the presiding genius who led the sawing-machine piencers, while Cristofori was the pre-eminent genius who first con ceived and developed the plano

It is true that others have improved upon the hand work of McCormick and Howe as well as upon that of Cristofori, but nobody has been able to eliminate the elements which they introduced into their respective inventions, and so long as those essential elements remain in their respective devices, just so long those inventions shall be attributed to the men we have mentioned But the plane invented by Cristofori was a mute and silent piano, and such it remained from the time it was invented, in 1709, until 1876, when John McTammany breathed within its wooden walls John McTammany breatned within its wooden wain-the breath of life, and henceforth it became a living, breathing, yea, aimost a human thing, until to-day it stands forth the unsurpassed and unchallenged king of musical instruments. The following definition of the player has been accepted by the plane trade as

authoritative

## THE SOLAR AND LUNAR ECLIPSES IN MAY, 1910

BY FREDERIC R. HONEY, TRINITY COLLEGE

An examination of some of the conditions which govern the moon's motion reveals the great complex-ity of the least problem. While the earth's volume is nearly fifty times the moon's volume, its weight is more than eighty times—the density of the moon being only six-tenths that of the earth.

As a consequence, the common center of grav-ity of the two bodies is within the earth at a distance of over a thousand miles from its sur-face, and it is this point which moves in an elliptic orbit around the sun. Twice each month the earth and the moon exchange places with reference to the sun The moon's orbit is an ellipse with the earth at one focus, and the plane of the orbit is inclined at an angle of a little over five degrees to the ecliptic. The ec-centricity is one-eighteenth, but the elliptic form is subject to great variations. The moon re-volves around the earth at an average velocity of a little over five-eighths of a mile a second, but its path in space is the resultant of its motion in its orbit and

of the earth's motion at a velocity of eighteen and five-tenths miles a second, illustrated at Fig 1 The arrows A and a represent the velocities of the earth and the moon in their respective orbits. When the moon is at M, between the earth and the sun, the direction of the moon's motion is opposite that of the earth At M' the earth and the d a represent the velocities moon are moving in the same di rection. At these points and at any intermediate point H" or H" the moon's path is the resultant of the two metions. The plane of the moon's orbit rotates slowly in a direction contrary to her orbital motion, and the perige a slow motion in the same direction as that of the moon

While the conditions which dotermine the moon's path plex, observations extending over plex, observations extending over long periods of time show regu-larity in the recurrence of eclipses. (See Scrytter Americ Can, September 12th, 1908) The direction of the line of nodes is shown in the plot of the earth's orbit for November 1909 at the te of the last lunar et lipse, s also in the plot for May, 1910 During the interval this line ro tates through an angle of over nine If the positions of the earth at the dates of the solar

and lunar or linees in May be carefully plotted, and the on's orbit magnified, the situation of the moon relative to the ecliptic may be determined by an inspetion of the plot The arrow A shows the direction of rotation of the orbit, and a that of the moon's

At the date of the solar eclipse (May 8 7 d ) the m orbit radius is projected on the plane of the ecliptic in the earth's orbit radius, and the moon's position in the earth's orpir featur, and the moons position is in that part of the orbit which is below the cellptic. This is shown more clearly in Fig. 2, in which the orbit is magnified one hundred and sixty times. The moon's position is shown at Greenwich noon from May let to the 28th, and also at the dates of the May let to the 28th, and also at the caree of the coclipses On May 87 d, the date of the total occlipse of the sun, the moon will be inserve perigse, and approaching the ascending node N which will be reached between the 10th and the 10th. The enlarged plot shows clearly that the moon will be below the ecliptic Its shadow will therefore be projected on the south-ern hemisphere. The path of totality will be between was inestupies: The next of totality will be between fulfilling the and 70 degrees south, and as a partial eclipse it will be visible in Australia, New Grinnes Januaria, and Java. On May 23 74 d he mone will be below the ecliptic, and will pass the descending node N' on the same day The beginning of the eclipse will be visible in portions of Africa, southwest Europe, North America accept. Alaka, Santh America, and the southern Pacific Ocean, the ending visible in South America, North America accepting Alakas, and the central and southern Pacific Ocean.

In Figs. 2 and 4 a portion of the earthy orbit in the particular of the control of the cont

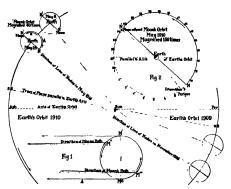

shows how points on the curve are obtained between the dates May 8th and 11th, Greenwich noon. To poster exhit radius is drawn parallel to the poster

for each date in Fig. 2, and the curve is traced through the positions of the moon. The orbit of the moon at the date of the solar occlipse is also shown in the

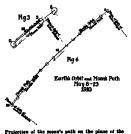

The earth during the May eclip

curve of the moons path (Fig 4) there is no point of inflection, that is, it is always concave toward the an. The earth moves about three and one-third times to diameter of the moon's orbit each day Figs. 5 and 6 are projections of the earth on a plane

Velocities and motions of earth and m of earth and moon in their respective or shows the moon's orbit highly magnified

arrows show the directions in which the eclipses will

The Fast Hall of the Future.

The principle of a mechanical delivery of mail has on established by the highly successful use of the pneumatic tube. This device is not the least conspicu cities, and probably will be applied to a greatly ramified postal enterprise in the near future. The chief question that arises in consequence is whether a system of delivery similar to that of the pneumatic tube can be installed for greater distances and at the same time afford an enlarged rate of

speed At the present day pneumatic postal de-livery is found only in the large cities, and be-ing restricted to local business, asks a rather exorbitant price for such service. It is plain that the employment of such a mode of distrithat the employment of such a mode of distri-bution to distant points consequently among the cities also must give a wholly new aspect to the present systems of commercial inter-course The first attempts made for the devel-opment of this lifes were those of a company formed in Paris. A recent number of Der Electrotechnische Anzeiger states minutely the techni-

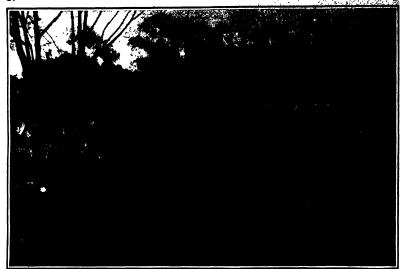

cal formation and other progress of this enterprise which has reached the singe of thorough practicality, the result of the quite facile function of the experi-

For the near future the Paris pany intends to connect the larger cities of France through electric postal routes that shall not have frequent intermediate stations. The rate of speed pro-posed is 250 km (155 miles) an hour. The capacity of the autohour The capacity of the auto matic express car is to be 2 cu ni (26 cu yds) approximately and the weight of a load consist ing of letters and other postal pleces of smaller dimensions shall not exceed 100 pounds

The roadied so to speak, on which such delivery shall be practisea must of course, be separ ated definitely from all other avenus of physical communication must be inaccessible to the oured only either through an elevated road or through a tunnel for their experimental road the company has chosen the latter device and has built a tunnel which contains two rails, one above the other and of which the (ross-section measures 8 sq m (5; sq yds.) For the round trip beginning at intermediate stations branches and switches are provided. The function of the experimental road, procured through an electric circuit, in such that the highest speed is The cars have two wheels which

reached very quickly run on the lower rail and also two rollers which fol low 'be upper rail and bold the cars in position The curs, moreover have a middle compartment for mail, and other divisions for the motors and the devices used as brakes. In front and behind the body of the cars is a conical point to diminish the resistance of this air. The frame of the cars is of iron exclustvely The motors are attached to the frame by means of levers which swing around an axis perpendicular to the direction of travel. The current is applied through an upper conduit and the brakes are worked through an upper conduct and the branch are so shows by compressed air as will as by the resistance of the air artificially increased by the wines attached to the sides of the front end of the cars. These wines stretch out to catch the air. This device can stop a car within one minute and in a distance of three kilometers after the current is interrupted but is used only as an acprevent the too rapid destruction of wheels and rails through the exclusive use of the rail brake, ce of most active friction

A patent recently granted to Carl Farkas of New York, describes a method for making invandescent lamp metallic filaments which consists in producing on a conducting core a highly refractory coating by on a conducting core a highly retractory coaling by decomposing in a vacuum the vapors of a salt of a highly refractory metal in the presence of vapors of pryagali, with final reduction in a vapor of hydrogen in detail, the vapors of chierde of chromium and pyro-gall are introduced in a vacuum containing the con-ductor, which serves as a core, which latter is then bested by the passage of a current, the vapors are heated by the passage of a current the vapors are thereby decomposed, nascent carbon from the pyrogali acting as a cement chromium probably being formed When the conting has thus been produced the vapors are removed and hydrogen gas introduced, whereby the deposition is reduced to metal

Some of the little craft that competed in the racing.

## MODEL MOTOR-BOAT RACING

BY H. D. JONES

Model motor-boat racing, a new sport, has caught the popular fancy in England, and is being taken up in all the inrge cities. With a view to encouraging owners of models to enter their boats in the various competitions, challenge cups are offered by the clubs, and the conditions are made so broad that every de-signer feels that there is a chance to win a trophy signer recision that there is a chance to win a trophy. The prizes are awarded for speed, for ownermanishly, for the general appearance of the models, for the behavior of the machinery and the performance of the beats white on the water.

Not less than 5,000 spectators gathered recently at

m Common, one of the many open spaces in South London, to witness the regatts on the lake The competition brought to the front some of the speediest racing models, some particularly fine ones of saloon steamers, liners, and torpedo boats, and other eraft that were built for appearance rather than for racing

The rules of racing were very simple started his model boat to run a straight line over the course at the end of which officials appointed for the purpose withed to "catch" the racers and return them to their owners. After the models were once started no interference was permitted, the sbillity of the unguited boat to keep in a like for the finish of the course being part of the qualifications for prize win

hing Over a course measuring fifty-one yards, four bosts were started in the first race, at which the accompanying prictures were taken. The best time was made by a steam hydroplane, the "Folly" in 9 15 econols, "Sunny Jim' a gasoline eraft, did the distance in 12 % seconds, "Mounty Jim' a gasoline eraft, did the distance in 12 % seconds, "Audia IV", a seasure, covered in 11 % 15 % seconds, and the fourth steamer, "Jdunno." In 21 seconds

in 21 seconds
On running off the final heat, boat against boat in
ourse the 'Sunny Jim' scored three wins, the "Leda
'U vac who and the "Iduning" one win thus taking
first second and third prizes in the order named
The prizes we subver uge The "Felly." the fastest
boat in the (limitaring trials, unfortunately ran off
off or course in the finals through the propeller fouling,
and out being able to get going in the others, she had
to give har Opposites a walk-over.

to give her opponents a walk-over Steering troubles were responsible for many awk-ward results in the other races. While halled by the sweetstors as adding greatly to the enjoyment of the regatta, the failure of the little craft to keep their pointing and the perversity of the machinery when

left to its own resources proved sources of great disset to us own resources prove sources or great cap-appointment to the owners of models that failed to keep a true headway. Boats that had run as true as a die on practice spins exhibited a tendency at the regatta to run anything but straight, or not to run at all Casoline motors refused to start, pumps gave out, boilers leaked and the models exhibited a cranki ness that showed there is a lot of improvement necessary before this sport can be brought to perfection. But that is why the regultas are encouraged. The weak points of the models are strengthened, and motor-boat building is benefited as the result of the mons learned from the eccentric performances of the models in the cup races,

The reliability of electric power in model regattas was demonstrated again and again, one finely-modeled liner, the "Fairholme," although not built for speed, scoring through the certainty of her performance and the untrustworthiness of some of her competitors.

The surprise of the meeting was the performance of a finely modeled gasoline boat, the "Silver Dart" So fast was this entry, that the officials stationed to catch the models at the posts could not reach her when a little off the line, and she sworved away Heading off down the pond, the little boat cluded a second attempt at seizure, and before she finally came to hand she had completed two round trips in brilliant if some what erratic fashion, to the admiration of the sp

tators tators. The expediency of running the regatins on a tirechar instead of a straight course is also emparing the large of the course of the cour The expediency of running the re-

parison with the work of other designers, a number of men with kindred ambitions are brought together in these challenge meetings, and the test of the new at a capabilities is thoroug

The sport has progressed so far that a national challenge cup is ready for the competing designers and model owners of the United Kingdom, and the various clubs are about to hold a general meeting to draw up rules for the government of the cup regattas Naval men are especially interested in the exhibitions. At the regatta, which was the subject of the accompanying pictures, Lieutenant William Barrett, R.M. attended with a party of naval cadeth and rendered national with a party of naval cadets and rendered many services to the committee

at of \$0,000 Candle-Power Street Lighting Plant.

BY ALTON P ADAM

As tungsten lamps require only 36 per cent as much energy as the carbon type for equal illumination, they have greatly reduced the cost per candle-power of in-

candescent streyt lighting.

What can b. done with such lighting in a small town is illustrated by the following costs and operating expenses for a plant to generate and distributing standard street lamps of 20,000 candie-power total.

Unlike the merely nominal rating of are lamps, which are a number of times their true candle-power. the tungsten lamps are rated at their actual mean can-dio-power in hecisontal directions.

The capacity of 20,000 candio-power is selected as

The capacity of \$0,000 candle-power is selected as nearly satisf for stress lighting in many medium and small tewns, according to the density of illumination required. It lamps of 40 candle-power are selected the capacity named amounts to 560, and with lamps of 30 candle-power the 38,000 sandle-power capacity will operate 180, the efficiency being the same in either

With 500 of the 40-and/s lamps spaced 100 fact parts, or 550 of the 80-and/s lamps and 600 ets app. 500 of the 50-000 feet in length of streets may be lighted such about the min light of streets may be lighted such about the same places, while ordinary remains may be obtained by specials deep feet parts 100,000 feet, or 18 mines, or streets. In the full wing estimates or the first costs and operating exposens of a 50,000 eanding-power plant, if it may be such as the full parts of the series and the series of the point of the exposure of the full parts of the series and the series of the point, for mach may be the series and the series of the point of the series and the ser With 500 of the 49-candle lamps spaced 100 fe

increase of cost would result

Operating expenses of the above plant will vary

with the number of lamps used even though the total candle power remains at 20000 because of the

cost of lamp renewals and also with the hours that

All night and every night lighting to the extent of 4 000 hours per year is the most desirable and costs

4000 hours per year is the most desirable and costs else per hour than lighting on moon and other sched nies that run down as low as 1500 hours yearly such all might and very sight lighting its gradually displating the short hour scrive and the following certaints of operating expanses is for lamps burning 4000 hours per annum With 500 drives lumps of 0 candle week making up the total 3000 candle one of the cost of the cos

power capacity of the above plant and burning 4 000

200 including \$710 for interest on the first cost of \$14.400 at 5 per cent. This expense of \$6.200 covers all depreciation of the plant as well as the operating

serpense that involve an immediate outlay of cash Apart from the interest charge 'he annual expense of operating the 500 lamps of 40 candle-power each during 4000 hours yearly in thus \$5.480 The total expense of \$6.200, including interest amounts to \$13.40

the annual expense of operation

justry for each of the 40-candle lamps burned 4 000 hours, or to 6 31 cent per lamp hour of burning. As each 46-candle tungstan lamp operates with 50 watts, the expense of 0 31 cent per lamp hour, including interest, amounts to 6 3 cents per Allowatt hour con

interest, amounts to a second por sumed in the lamp The same conclusion is reached by considering that at the efficiency of 126 watts per candle-power the production of 20,000 candle-power requires the delivery

of 25,000 candle-power requires the delivery of 25,000 watts at the lamps and this during 4 000 hours amounts to 100 000 kilowatt hours, which into the annual expense of \$6 200 gives 62 cents as bo

The Conlings Oil Bistrict, (alifornia. fornie A report on the geology and oil to sources of the Coalings oil district in the western part of Freezo and Kings counties California by Raiph Arnold and Robert Anderson has just been pub-The second second 

Montarcy 110 miles away with San Francisco Bay 200 miles away and with other points

The report describes the topography geology paleon plogy and oil in the Coalinga district which have en in part described in an earlier report published the Survey but not now obtainable. The present by the Survey but not now obtainable report includes a more complete discussion of the district and many new maps sections and other illus-trations besides a paper by Irving C Alicn on the chemical and physical properties of the oils Man-interesting points in connection with the history of th macressing points in connection with the history of the region in past geologic ages are brought out and by means of careful descriptions of the formatine a foundation is laid both for an accurate study of the occurrence of oil within this region and for the tracing of formations and oil horizons in other parts of Cali

the report covers 354 pages and includes 52 plates and J text figures. The characteristic fessils of the tocks of the region are fully illustrated. These afford a means of identifying particular strata from place to

a means of identifying particular strats from place and of determining the depth and position of the oil bearing sands like discussions of the oil rones of the factors affecting the accumulation and the gravity of the oil of the relations of oil and water and of the origin of the oil are of broad general interest The maps and diagra the detailed accounts of the geology of the wells and the chuseter of their vari ous products are of decidedly practical immediate value

Bulktin 198 may be obtained without it by applying to the Director of the Burvey at Washington

The Current Supplement,
The opening article of the current
BULLEMENT No 1740 deals with electro chemical action and boiler corrosion

View of the lake, showing the start and fixtures on the poles for 500 of these lamps all erected and con those lamps all erected and con sected complete and ready to operate For this 30 000 candle-power plant as above with 500 lamp fixtures erected the total first cost is \$14 200

The "Minnehaha" being token out for evector the total first cost is \$14,200. The "Mileston Tile costs per cantileprower capacity giving \$2540 per 40 candle lamp. This cost of plant is based on present market prices of materials ishor and apparatus and assumes ordinary conditions at the place of evection. In places, where prices and freight rate, are higher than

lished by the United States Geological Survey as Bulle

tin 398 The district described which is about 15 miles wide and 50 miles long stretches along the northeast base of

the Diablo Range and in cludes a band of productive oil land i miles wide and is miles long at its north end and a narrow strip of oil land along its southwestern boundary

The region includes about 550 producing wells which range in depth from 600 to 4 000 feet and ponetrate from 20 to 200 feet of oil sand. The product ranges from a black oil of 15 deg. Baumé to a green ell of 3 deg. Baumé. The yield of single wells differs greatly

oeg saume 'ne yield of single wells olin'rs greatly ranging from 3 to 3000 barrels a day.

The district is the leading producer in california and ont of the most productive in the world Its production in 1907 was 88717.73 barrels in 1904 it was 10 388 188 barrels, and in 1909 it was probably if

700 000 barrels or more
The total quantity of oil thus far taken from the ground in the district to the end of 1909 was about 63 000 000 barrels of 42 gallons each leaving available a vast store of oil which has been roughly estimate da 2.747,000,000 barrels. Even if this great quantity of oil is in the ground it is not possible to state whether all of it can were be obtained. Pipe lines connect the district with the scaboard at

there is often much loss thinking and loss taiking concerning the stability of occasioning steamers among those who ought to be built in formed than commaints made sometimes are in to find eat. The matter is set right in an ear-line article stitled Stability of Snipe Edward Person gives some interesting case concerning the constitution. ## ROUGIER'S SPECTACULAR MONACO FLIGHTS

BY THE PARIS CORRESPONDENT OF THE SCIENTIFIC AMERICAN

A year ago, despite the offering of substantial prizes for flights across the liny of Mouseo, no avi alor made the attempt. This year housever, such hig strides have been made in the art of light that there probably a gaver of substores who are willings to try a flight out water, even without any special grangements he hig, made, for landing in this ele-

much in case they are forced to do this. With the spectrular flights of Paulhan and Charles K. Hamilton over the Pacific Ocean last January as an example, longier, a famous French cyclist and untomobilist who has lastly joined the flying ranks early last month made some thrilling flights above Mousac Bay photographs of which we reproduce

carly last month made some thrilling linguia above. Monaco Bay photographs of which we reproduce. The first flight of an aeropiane over Monaco Bay was made on March 3rd Starting from the quay. Rougier described a figure (light above the bay and flew our Cape Martin at a height of 265 feel. He landed safely at his starting point after a flight of the intended.

Nonpie'rs second flight above the bay was made on the 6th utiline in the presence of the Prince of Monace and a large number of apeciators. This and the flight the next day were each from 5 to 10 minutes' duration. On the 7th he passed 100 front above the line of fortifications as abown in our front-page

illustration, and flew straight across the bay, attaining a height of 1,000 fet above Cape Martin Despite some rather strong wind mails into illustration and and without tipping dan and without tipping dan grounly On his way back to the starting point Rougier performed evolutions above the castino of Monte Carlo at a height of 300 frest Flankly he flew back in the rock of the wake in the rock of the castino and the same precision upon the narrow ones.

On March 8th he again started from the quay of the port, and five straight for Chap Martin, across the bay 11 row to a beight of 600 five the seribed a circle above the bay passed over the rocky shore at Monaco and lands at his cast sized lands at his longest and man spectraline flight. The nort day he made his longest and to 10 MeV. Marting at 1 to MeV. Marting at 1 to 10 MeV. Startling at 1 to 10 MeV. Startling at 1 to 10 MeV. Startling has the lands at 10 MeV. The series are the series of the series

Then, still rising, in fiew above Mont Eged felvers of 20% feel; Dashing over the summit, he fick to 1.4 Turbh, where he turned at a height of 300 feet, and few back to his satring point. The length of this flight was 28 minutes and 15 seconds. On March to 10th Rougher assain fiew around the Bay of Monnec and on the 17th in made another the Bay of Monnec and on the 17th in made another the Bay of Monnec and on the 17th in made another the Bay of Monnec and on the 17th in made another the Bay of Monnec and on the 17th in made another the Bay of Monnec and on the 17th in made another the Bay of Monnec and the 18th of the 18th of 18t

## Asronautic News at Home and Abroad.

Resides the record sights by Rongier above Monaco Naz, Le Bion, souther famous automobile racing afterwho has been flying a Bieriot monoplane, made a wonderful light above the Bay of Ran Schastian, Rpain, on the 2nd Instant: the started in a high wind, and made several circles above the bay at a height of Defeet, when suddenly the monoplane taged upside down, and fell into the shalines waiter. The interpold cover, and fell into the shalines waiter. The interpold cover in the shalines were the shall be shall be

cossive power and the gyroscopic action of the motor undoubtedly had something to do with both of these fatal accidents. Le Blom made a speed record of 43 3 miles an hour (5 kilometers in 4 minutes 2 seconds) at the Heliopolis aviation meeting pear Cairo last January

## ACCIDENT TO A CUSTISS SIPLANS.

While fifting in a Curtiss biplane above 6an Frantice Bay at Alameta, Cal., on the 6th instant Frank Johnson plunged into the water from a height of 30 feet owing to his losing countrol of the architecture of the country of the country of the control of the architecture himself from the aeroplane, (which was not haddy along any of the country of the country of the country of the property of the country of the country of the country of the property of the country of the country of the country of the property of the country o

### FIRST TEST OF PARSEVAL MONOPLANE.

The first test of Major von Farseval's large moneplann occurred on the 14th instant above Lake Plau, in Ocrusary This machine lass a spread and length of 45 feet, and is fitted with a 13bborse-power de-plinder motor. The trial fights were made in a violent and gusty wind with two men in the machine. The moneplane capsized, and fell into the lake. The two ongineers, 10st and 18to human, were reacoud. This mathine is previoled with both wheels and floats, but

No trace of Dr Cook's ascent could be found on either of the two peaks which constitute Mount McKinley No records of his were discovered

Various cetimates have been made of the moun tain's height. W A Dickoy, an American prospector, estimated it at 20,000 feet, and gave the peak its present name. Robert Dunn, who made four attempts to climb the peak, estimated its height at 20,300 feet.

Insamuch as the present party was not properly equipped to measure the height of the mountain, its achievement is not of much asfentite wature much as feet the present of Columbia the past regarding to the past from the cilmbia the past regarding to the past from the south the past from the south the glester and various phenomen. He will take glester and various phenomen. He will take with him scientific instruments, by the skillful use of which undoubtedly

more information will be obtained than could be secured by a party of four unscientific but hardy explorers. Barril, the guide who exposed Cook, is inclined to disbute Lloyd's claim

### A New Way of Lighting Mages

A new system of electric lighting for theator sweez as tried not long since at the importal Opera of Berlin, and, it is stated, with great success. It is the inswittion of the Spanish engineer, Fortuny, and uses an are lamp as the source of light. The rays of the importance of the state of

## An Automatic Projecting Lantern with Electrical Control

BY JACQUES BOYER

Hitherto it has been necessary for a lecturer using lantern illustrations to employ an assistant to operate the lantern and insert each slide at the proper moment M Moulin has invented an automatic lantern (Fig. 1) which dispenses with the services of the assistant. The ingenious mechanism which inserts and removes the slides can be adapted to any projecting lar the sildes can be adapted to any projecting lantern and enables the lecture, by pressing an electric but ton on the platform, to show any picture at will The invention will be especially serviceable to teachers, as is shown by Fig. 4. The pictures can be thrown on the white wall of the class room, and if a powerful source of light is employed it will not be necessary to darken the room to an extent sufficient to prevent the taking of notes or the use of the blackboard

The lantern slides are attached to a conveyor, com posed of two chains connected by grooved cross-bars, which pass over a skeleton drum, formed of two iron disks connected by six rods Each slide is firmly held between a fixed and a movable but of the conveyor by

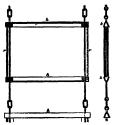

Fig 2.-Frent and side views of chains carrying slide holders

the tension of the apring r (Fig 2). The drum is turned by a small electric motor, by means of a tau gent arrow, and, as it rotates, the slides are brought successively opposite the projecting lens

operation the flexible con veyor carrying the slides is taken up from a box behind the drum and delivered to a receiving box beneath the

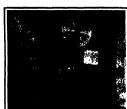

The motor wound, so that it can be reversed by reversing the current in the armature current in the armature coils. In this way a slide which has alroady passed the lens can be brought back and projected again, if desired The electrical connections by means of which the apparatus is con-trolled are shown diagram matically in Fig 3 Be-neath the locture table is a switch I, the closure of which sends a current through the electric are A of the projecting lantern, and also through the field culls 8 of the motor, which with the circuit containing the are and its rhecetat On the table are two double contact keys a and a' upper contacts of these keys, 1 and 1', are connected with one wire of the gen-eral circuit, the lower contacts. 2 and 2', are con-nected with the other wire, and the fixed ends of the keys are connected, re-spectively, with the two attached to the rotor or mature B of the electric remove a ur use electric sotor. Hence, when neither ay is depressed, both reades are in connection with the same main wire, at no current flows

By pressing the key a, the current is seni tionies By pressing the way of the threats as well through the rotor circuit in the direction indicated by the arrows, and by releasing a and depressing a the current and the rotation of the motor are reversed. incandescent lamps L and L' are bridged on the

Fig. 1 .- An automatic projecting lantern.

keys to diminish sparking but they also serve another usoful purpose When the key a is partially depressed so that it does not touch either contact, the rotor cir cult is completed through the lamp L, which greatly increases the resistance of the circuit, and the current flowing through the rotor is further diminished by more than one-half by the shunt effect of the lamp L' Hence, the motor trans-Hence, the motor turns so slowly that it is an casy matter to stop the desired silde exactly in front of the lens, by releasing the key a at the proper mo-ment. Neither of these effects is produced when the key a is fully depressed, because the lamp L is then short-circuited by the key and the resistance of the circuit is thus made so small that very little current is diverted through the other lamp. A slow movement

of the motor and the slides in the reverse direction is similarly produced by partially depressing the key i Tides of Pass

The average time of high water at places on the Pa cific coast of the Central American isthmus is three hours after the moon's meridian passage at Panama The average time of high water at Colon is six minutes, and at Greytown one hour after the moon's meridian passage at Colon In other words, as Colon and Panama are nearly on the same meridian, it may be stated that high tide will occur at the Pacific or Panams old of the Panama Canal, on the average two hours and fifty-four minutes after high tide at the At lantic or Colon end, and high tide will occur at the Pacific or Brito end of the Nicaragus Canal route two hours after high tide at the Atlantic or Greytown and

The level of mean tide is practically the same at both onds of both of these isthmian canal routes, but at Panama the tide ranges from 10 feet above to 10 feet below mean sea level, while at Colon it only ranges from 6 or 8 inches above to 6 or 8 inches belo

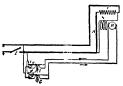

Fig 8 .- Electric withing for automatic projector.

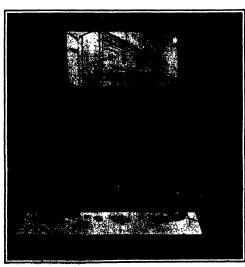

mean sea level, and at Brito or San Juan del Sur the tide ranges in the extreme from 4 feet above to 5 feet below mean sea level, while at Greytown it ranges less than 5 inches above and below mean sea level

Thus with a seabyel canal built along either the Nicaragus or the Panama route, there would be through currents from the Pacific to the Atlantic at the times of high tides at the Pacific termini, and from

the Atlantic to the Pacific at the times of low tide at

the Partie travial In answer to the spe question Assuming that the Pacific tide rises about 8 feet suppose it to be high tide at San Juan del Sur Nicaragua, at noon stand ard time, what would be the approximate difference in level of the Atlantic at the same time sav at town Nieragus" i it may be stated that at the time of high tide at San Juan del Sur it is two lones after high tide at Gary town, and if the assumed del Sur la above me in sen level the difference in level between the two ends of the ennal would be about 7%

mation with reference the weather conditions Dr William Shaw Director of the Meteorological Office of Great Britain, has been traveling in western Cantraveling in western Can-ada With reference to the alleged general changes in the climate owing to the settlement of the country Dr Shaw is skeptical He that the people of all locali ties are under the impres their district is undergoing a change. # INSECT PESTS IN HOUSE AND STORE

BY HAROLD BASTIN

Insects as a class feed literally upon anything and everything from which nourishment may be extracted by dint of strong laws back d up by equally strong directions A substance may be bone dry, almost as hard as rock and in every way uninvising, yet so

long as its origin is three-able to the animal of vestable three animal of vestable three-animal of the animal of vestable three-animal of the animal of the animal three-animal three-anim

thequer of this country by such leavests as the Colorado bevelo and the "scales" of the orange groves. But it is with certain posts which while lead evanating in their activities, affect clearly the individual comfort of our readers that writer proposes briefly to deal in this place. Probably fee people realize what a number of insect pests were prepared to the very father or our dwelling pages.—that is, so far as the woodwork is concerned. They herewise how our furniture and our books, and con sume by alow degrees the very carputs on our foors and the clothlicity in our closests and presses.

Among the most widerly distributed of these domestic he posts are certain tup bestics of the genus Anobius Their antevetral home was in the woods and lance where they are utili abundantly corresented, frequenting the dond branches of trees and shrubs. They have been considered they have been considered to the control of the control of

scattered about the surface of the woodwork—much as though the piece of furniture had been "peppered" from a distance with a charge of durchot. These signs are indeputable evidence that your chair is bestle-riddied, and unless by some means you can

Clause demaged by the tabacco bestle,

contrive to dislodge the pests, they will slowly but surely reduce the woodwork to dust and chips

When once a piece of furniture is assailed by Anobiam, it is a very difficult matter to cradicate the post. Several methods have been suggested One plan is to place the piece of furniture in a refrigerating chamber

Dust from the borings the cork-caterpillar on a bottle-neck

ine bottle cork showle

for a week or two, and thus attempt to kill the beetles and their grubs by cold. It is somewhat doubtful, however, whether even this severe ordeal will destroy all the beetles. Another way, and probably a most effectual one, is to place the furniture—first taking it to pieces if necessary—in a hot chamber or oven, and there bake it for twenty four hours or more. If the

temperature be kept h little above that of footing water, not a single bestle will be alive when the lighing is over. Often it would be impossible to adopt either of these methods, and in such cases the best plan is first to place the piece of furniture in a very

to place the piece of turniture in a very hot round for some hours, these to inject, by means of a very fine-cone ject, by means of a very fine-cone crossors or craphic of potassism—tels as many of the tity "worm holes" as can be found on the surface. Then remove the furniture at once to a cold place, when the sudden change of temperature will cause the potencion faune to be drawn into the impremient reto be drawn into the impresent proboise on the surface should be stopped up with parafilm wax.

The various species of Anobism, and their bigger relatives of the ganus Restobium, by no means confine their attacks to furniture The whole wood-

work of old houses has been so completely ridded by their borings as to render the structures unsafe. Indeed, a beam that has been tenanted by these insects for a number of years is little better than an outer shell containing a mass of wood-dust. A photograph showing damage done to woodwork is here seyned done to woodwork is here seyned when the shewing damage done to woodwork is here seyned with a done was also in in the shall of making a tag-with a done when also is the shall of making a tag-with a done when the shall be should be shall be sha

### PERSON CONSTRUCTION AND OUR ANNUAL FIRE LOSS.

It is estimated that our annual fire loss and the am expended for fire protection, etc., represent an annual sum that is approximately equal to the cost of building the Panama Canal The public is

awakening to the cance of this fact, and business mer rally are boginning to realise that the best way selves against the fire peril is, not so much to institute extinguishing fires and burden themselves with heavy insurar ce, as to so greet their build. ings that it will be difficult for a serious fire to origidoes, imp for it to obtain a

Applying the plaster to a rib-stiffcued steal lath and plaster p

both the ribs and the inth being made from the same shoot of steel. The object of the ribs is to give suffi-cient attifaces and rigidity to the fint, so that are required by the ordinary plain lath, will be necessary. When it is used as reinforcement for foor and roof slabs, no wood centering or falsework is re-quired, for the ribs give the required stiffaces. If this sheathing is used for partitions, it is most provided to the results of the required stiffaces. If this sheathing is used for partitions, it is more becausery to provide a fastening at the foor and the ceilling. The sheat are then eat in usace and the

wweenty to provide a matering at the noor and the sling. The sheets are then sot in place and the laster applied directly to both sides. For sidings of factories and similar one and two-tory buildings, a framework of steel or controto is

Building a roof of reinforced concrete construction,

### FIRE-PROOF COMMERNOTION

for it to outsin -serious hold upon the building The growth in favor of fireproof con struction has been indirectly stimulated by the growing price of lumber, the advance having been so great that for some forms of construction there is but little extra initial cost involved in putting up strictly fireproconstruction. Indeed, from an investment standpoint it can be demonstrated that the fireproof building is construction. Indeed, from an investment standpoint it can be demonstrated that the freproof building is the only really economical building. The saving in the cost of insurance, reduction in depreciation. the only really economical building. The saving in the cost of insurance, reduction in depreciation charges, the guarantee sgainst interruption of busi-ness by five, combine to make an unburnable building the cheapest in the long run.

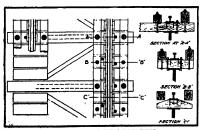

The phenomenal development in reinforced concrete

construction must be regarded as one of the most sig nifeant movements in the broad field of architecture d engineering It is not too much to claim that and engineering It is not too much to claim that the blow's share of improvements in this direction is to be credited to American engineers. The experi-mental work on sample structural members, and espe-cially upon beams and columns, has led to a pretty thorough knowledge of the tree principles of cen-struction to be adopted for reinforced concrete when used in such members, and the introduction of a reinforcement designed to selecutely take up the sharing strains, as supplied for instance it has belied system, has made it possible to produce hums define experiments. The sharing strains and other members subject to bending provided to which the sheets are attached. Lines of orts are provided, about six feet apart and the ly Rib is properly fastened to them. The fram work is similar to that which would be provided where the ordinary wood sheathing or corrugated from used, except that the girts can be placed a greater distan When the steel has been properly e apart. placed a special stucco plaster is applied in two costs

Where the system is used in connection with floors and roofs, supports are ordinarily provided about five feet apart. The aboets are laid directly over the sup-ports with the lath face downward. All that is necessary to complete the work is to put in the concrete on the upper sides of the sheets to the required thick ness. Only a sufficient amount of concrete will flow through to give a thorough clinch on the steel leaves a roughened surface on the underside, which provides a satisfactory key for the plaster applied on the ceiling below By use of reinforcing materials similar to this, nearly every type of building no mut ter how small, may be built firsproof at a cost very little greater than the ordinary wood framing

IMPROVED BLEVATED BAILWAY CONSTRUCTION The combination cross tie and tion shown in the accompanying drawing has for its object to reduce the not

panying drawing has for us so of elevated railroads and increase the light to the street below. An open con struction is provided yet the rails have an almost continuous support which continuous support which tends to absorb and stop the vibration sent out from the rails. Most of the noise from a train on an olevated structure is due to the pas-sage of the wheels over the rall joints and there is no doubt that this noise is intensified by the inefficient support of the rails at such points. Should the three "block" ties be removed, letting the rall free of sup port, and a wheel be rolled over the rail, the vibrating noise would be very great By inserting 'block' ties between, this noise is de-creased in proportion to the

PEPROVED ELEVATED BALLWAY CONSTRUCTION

s, whose strength can be determined with dele accuracy.

pencion)s accuracy.

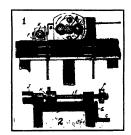

Side by ride with the development of reinforced
concepts members, such as are suitable to what might
be called the skeleten frame of concrete building,
maps, experimental work has been done in producing sixph experimental work has been done in producing an absolute form of wailing or panelius, for filling fat the bread opes surface represented by the wail agence, the drover such care cording. In the accompanying illustrations we show what is known as the 10-28 method of stool absolution, which is an interesting open of stretchment flower that the consistency of the contract of t number of ties inserted until when a continuous sup number of the inserted until when a continuous apport is made the noise is reduced to a minimum it is but natural for engineers to copy precedents, and for this reason the usual system of cross ties, which, by a process of evolution, has been found most satisfactory for a road constructed on the ground has been adopted for elevated railroads, with th has been adopted for elevated railroads, with the result that an excessive amount of noise is produced whenever a train passes over the rails, and the street is uncoessarily darkoned by the multiplicity of cross ties. This proposed system of building an elevated railroad has been engagested by Hr Carl E. Klok, of 1243 Columbia Avenue, Chicago, III.

## ATTACEMENT FOR WOODWORKING MACHINES.

The accompanying engraving illustrates an attach ment for woodworking machines generally known as molders or stickers used in such and door factories for cutting rabbets and moldings in the parts to receive the panels. When a door is to be provided with a pane of glass, it is usually necessary to cut away the molding or rabbet at one side so that the glass can be inserted when the door is completed and be held in position in the usual manner by means of putty - 10 to avoid a second on ration to cut away the n ing for this purpose the auxiliary enter shown in the accompanying engraving is provided. The auxil-iary cutter is arranged to be moved axially into and

out of operative position, so that when it is no longaway the molding the operation of the auxiliary cut ter can be stopped in Fig. 1, which shows a face view of the machine the main shaft is shown at 4 and mounted upon it is the main cutter head, provided with the cutters B which form the rabbet and mold ing immediately In front of the cut-C on which the

work is supported and a pair of guides D for holding the work in post tion. The auxiliary cutter is mounted on a shaft F. It consists preferably of a square cutter head provided with a pair of blades F. Fig. 2 shows a side view of tion the auxiliary cutter moved to inoperative position so yoke and collar H by which it may be moved axially so as to bring the cutter into engagement with the

A NEW SYSTEM OF RIGH-TRUSION INSULATION

STRIPLE LETTER SOAIR.

An inventor has recently struck upon the simple idea of using coins to weigh letters, so that the value of the coin will represent the value of the stamp that of the coin will represent the water of the scamp tast must be applied to the letter. A simple beam scale is used provided at one end with a slip for holding the tester and at the other end with a slip for holding the coins. If the scale is to be used for first-class mail the rates for which are two cents an ounce the riterum of the scale is so place of that a letter weighting an ounce would be just counterbalanced by two onean ounce would be just count-relatanced by two one-cent coins in the other cipl. As shown in our filtu-tration the scale beam is made of sheet metal beat to channel form with the cufe turned over and termin sting. In kulft deged prious on which the letter and clin clips are suspended: A detail of one of these clips is shown in Fig. 2. It is made of a single piece of metal bast to firm two jaws which may be registent or crimped to provide a better gripping surface. At the upper and of the clip are two cars bent upward and provided with apertures to receive the pivots of the scale beam. A ball shaped handle serves as a fulcrum scale bound. A ball shaped handle serves as a faircrum for the scale. In order to adjust the scale securately a metal polar is provided on the under side of the which has alternum and the polar and are bent back upon it to hold it in place as indicated in Fig. 3. The polar may be delicately adjusted to bring the scale to a correct balance. The inventor of this lagen into letter scale is far Willia J Fink, of Bin Point South Dakota

INLET VALVE AND SCREEN FOR PUMPS

device which is illustrated in the accomping engraving is adapted particularly for use in con

SIMPLE LETTER SCALE

nection with water pumps in boats the object being to strain the water that is drawn in by the pun strainer is provided with a special attachment whereby it may be () ansed instantly while the valve is in sorvice. The body of the valve is indicated at A in the sorvice. The sony or the varies is indicated as a in case illustrations and is provided with a branch B whereby it may be connected with the pump. The lower portlop of the body is enlarged to form a valve case C. Screwed or tan boody is omarged to form a valve, cage C. Seresson to the cage is an extransion number D which at its lower end is found with a screen E. A valve seat plate F is secured in the chamber O and upon it rests the valve O i uns H in the top of the chamber O tuns H in the top of the chamber O. serve to limit the upward lift of the valve & Passing centrally through the valve and casing is a rod J which at its lower end is fitted with a pair of blades A. DILET VALVE AND MIRROR FOR PURPL

surface of the screen H under tension of a coil spring L By rotating the rod I the bindes K are caused to scrape the screen H, and thus remove any dirt that might clog the openings of the screen. Mr Olof E. Lillyman, of Potiatoh, Idaho, has just secured a patent on this improved inhet varive and screen

THE INVESTOR OF DIVISO ARROR

Among ploneer investors to whom the diving dress in its present perfected form ewes so much, was Wil-liam Hannis Taylor The previous 'hit or miss attempts were su

perseded by the Taylor patent of June 20th 1838 (No 578) in which the essential featur was the valve allowing the emission of con-sumed air without an influx of water Previ ous to this time there had been the diving chests and the diving bell of which the lat ter introduced by Smeaton in 1778 was the safest and most practical device for submarine exploration The diving bell been developed along aide of the diving dress and is still in use

The general appear ance of Paylors diving armor was like that of a knight s suit of mail

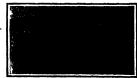

FIRST DIVING ARMOR.

except for a prominer bulge in the body ple A large pipe com from the surface and penetrating the body piece at the bulge supplied the fresh air while a short pipe entered the body piece on the other side and was provided with a valve which carried off the exhaust Although diving armor has now reached its terfected state this valve has never been materially improved upon The accompanying illustration is re-troduced from Mr Taylors patent

### AN IMPROVED TORAGOO PIPE.

The principal objection to a tobacco pipe as every smoker knows lies in the fact that nicotine accumu smoote grows nee in the inct that income second ince to such an extent as to partially clop the stem and detached partition of the distrateful drug are apt to be drawn into the mouth. The saliva is also apt to flow into the stem and collect there. To obviate those disagreeable features of the ordinary stem many inventions have been made designed to trap the saliva and the nkotine. The accompanying ongraving illustrates one of the latest inventions along this line. The pipe bowl is provided with two openings one above the other and these are adapted to communiabove the other and these are adapted to communi-cate with two channels in the stem. The stem is pro-vided with a core piece in which the channels are formed. The core is indicated in the cross sectional view. Fig. 2 and is shown in full in the large view. Fig 1 The upper channel extends the full length of the core and through this the smoke is drawn Near the inner end of the stem the core is provided with several ducts extending downwardly a wardly to the lower channel of the core so that any nicotine or solid and liquid particles drawn up with the smoke will be trapped by the ducts and will accu

AT INFROVED TORAGOO PIPEL

ulate in the lower channel. It will be of mulais in the lower channel It will be observed that the lower channel does not extend the full images of the core, so that it is impossible to draw any of the core, so that it is impossible to draw any of the core a chamber is formed in the bottom of the core a chamber is formed in the bottom of the core piece which communicates with the smoke channel mear the mostlypice. This serves to trap the saftre that may enter the smoke channel. The ptem of the pipe is jointed near the center so that the outer seek that may enter the smoke channel. The ptem of the pipe is jointed near the center so that the outer seek that may enter the smoke channel. The present of the pipe is jointed near the center so that the outer seek that may only the present of the pipe in the core pipes without part of the things that the core is the core pipes of the present of the safety of the Books is the lower in the pipe of the present of the present of the pipe is the core in the pipe of the pipe is the core in the pipe of the pipe is the pipe of the pipe of the pipe is the pipe of th d pipe in Mr Georgia Bradley, of 919 Ib Spokane, Wash.

The is one of the most byleview pairs with which core marchest have to centend, despite the smallness of its size. I am able to reportupe a magnised photograph showing a few grains taken from a sample of wheat which had been at tacked by Celemétre. The sample fairly represents the condition of a whole cargo of wheat which was rendered practically variouses string a protracted vorage and whole the condition of a whole cargo of wheat which was rendered practically armounted to the condition of the control of t somewhat exceptional. Nevertheless, the corn weavil imposes a constant at anyon stored grain, while it is no exaggeration to state that every granary is infected by this peet. Thus, countless millions of the insects must be ground with the wheat into flour each year, and the weavily must, therefore, form an actual part of the bread which we eat

Another corn pest is a small moth which is especially injurious to stored four Its scientific name is Bepherical kenkerica it is the scourge of the Medi-terranean ports, where it is impossible to stimate the extent of the damage which estimate the extent of the damage which is accomplished. In November, 1887 Ephcetic made its appearance in East London—having been brought thilter, no doubt, in ships. Its presence was fitted detabled in a warehouse at the docks Unluckity, over a thousand tons of flour were stored in close proximity; and, all though all possible efforts were made and though all possible efforts were the extensive them. extraordinary rapidity that the trouble taken was of no avail.

Enggy-top Canopies for Launchea, Experiments have just been completed by the naval constructors with a view to the adoption of a new type of canopy for use on the naval launches Whan the launch of the U S S. "Minne-

when the launch of the U S S. "Minne-sota" was lest in Hampton Roads with several midahipmen on board about a year ago, the fatality was attributed to the fact that the canvas covering used as a protection against the weather was a protection against the weather was fastaned in such a manner that it could not be quickly released, and the men were hopelessly imprisoned in the sinking boat This fact led to much criticism of the type of canopy used and the steam taunches came to be known as 'death

trags."
The constructors have been working on a design intended to overcome that directly, and several types of changies were tested on launches of the Atlantic fleet within the last two or three months The result of these tests is the adoption of what is commonly known as the bugg-top canopy. This is made of can the second of the common that the second of the sec

to those used on automobiles

While the new style of canopy will not
be as durable as the old fashloned one,
and will not afford the same protection
against wind and rain, in case of a collision, and the leunch is in danger of being sunk, it can be quickly put out of the way and not endanger the lives of ants of the boat

# MARK TWAIN'S WORKS

at ONE-HALF former price

It has been marn aware to have his books in every American home, and he has made a great personal sacrifice, which brings about this remarkable situation—for the first time in the history of publishing, copy-righted books are sold at the price of non-copyrighted books.

## **AUTHOR'S NATIONAL EDITION** 25 Beautiful Volumes

Mark Twain is the youngest man of his day. All his books are imbued with his spirit—they are new books, to own them is always to have new books, a fountain of youth. They never age because humor, kindliness, and truth never grow old. They are books for young people of all ages.

## Special Features of this Edition

Mark Twain himself has written a preface to the edition Brander Matthews has written the biographical criticism of Mark Twain and his work. There are portraits of the author from photographs and paintings taken at periods portrais of the author from photographs and pannings taken as reverse when the different books were in process of writing I has edition includes his later collected writings such as "A Dog's Take," "I ke's Dany," etc.

There are beauful pictures by such artists as BROWN, FROST, NEWELL, BEARD, DILLMAN, SMEDLES, JUILLEDING, MEMBLES, GILRERY, MORA, WILDON, KEMBLE, GILRERY, FRANCE, CLINEDING, MORA, WILDON, KEMBLE, CLINEDING, MORA, WILDON, KEMBLE, CLINEDING, MORA, MORA, WILDON, KEMBLE, CLINEDING, MORA, WILDON, KEMBLE, CLINEDING, MORA, WILDON, KE

### WHY NOT A GOOD BOADS LABORATORY!

A life problem of maintaining good roads, always a most important one in the United States, has recently been rendered of critical urgency by the rapid development of the auto-the most destructive vehicle to road surface monise—the most destructive vehicle to road surface that ever ran on our modern highways. The public re-sontment or regret, as the case may be, against the destructive effects of automobile traffic should be tempered by the recognition of the fact that it has been the most active instrument in awakening the public to the necessity for abandoning the old slipshod methods of road building, and constructing them according to the best engineering practice if it were possible to rebuild all our roads of the

If it were possible to robuild all our roads of the most approved and highest class of construction, and if the most suitable material were everywhere available, the problem would be greatly simplified, but such uniform excellence is impossible, both because of the cost and of the difficulty of finding the ideal the cost and of the difficulty of finding the ideal materials within economical hashing distance of the work in a country of such wide extent and such varied geological formation as the United States, the question of the best kind of react to build in any locality must be determined largely by the local con-ditions—the climate, particularly as regards the amount and distribution of the rainfall, the nature amount and distribution of the rainfall, the nature of the underlying soil its bearing quality, capacity for quick drainage, etc., and above all, the character of the materials available for road building, must all enter into the problem

enter into the problem

The French engineers, with their characteristic
thoroughness, have iong recognised the importance and
complexity of the good roads problem, and nearly half a century ago they commenced that careful invest a century ago they commenced that careful investi action which is still being certical on by a force of trained experts. The analytical study of the subject, while was set on foce by M Buttle, Regimer of Roads and Bridges, as far back as 1868 has developed into the present municipal laboratory, which has so greatly extended its field of work that today it is considered by many to be the finest in estimates. the date mentioned, apparatus was installed for testing the restantance to paving materians to wear by rric-tion, which was followed by a machine for testing the resistance to abrasion of the stone used in Mac-adam roads The laboratory also includes means for artificially producing those conditions and forces of a climatic character which tend to break up and destroy road surfaces

road surfaces

Now here, it seems to us, is a plan which might
very well be followed in this country by the founding of a national good roads absortator, any at Wash
ington, which might co-operate with similar but
smaller institutions provided for and controlled by
the various State legislatures. The cost of carrying on such institutions would represent but a moderate percentage of the money that is annually thrown away on the construction and so-called repair of highways by the present defective methods.

### RATIONAL STREET LIGHTING

HE proper lighting of a city is not so much a question of the total quantity of light provided as it is of the proper distribution. Because of the fact that America is the thiplace of modern electrical lilumination, and the nitry is which it was first developed on an axtendry in which it was first developed on an axtendry. country in which it was first developed on an axion-sity scale, there is a popular impression that our municipal lighting is the best in the world, yet it is a tritt that, because of the unscientific way in which we have distributed our lighting, the result-ant illumination, judged by its adaptability to the

ds of the user, in far less satisfactory than it might be, and, in its general results, is not so of ficient as the lighting of European cities. This question was recently dealt with by Dr Louis Bell

consider was recently deast with by Dr Louis Bell in a paper reach before the American Booteley of Municipal Inginovaments at its annual conventions, and the principles which he lad down are at once so obviously sound and so frequently diregarded, that they are well vortipy of careful study by the municipal authorities throughout the country. The hundamental criticism against most attempts at street lighting lies, according to the author of the paper, not so much in the illuminants used that the paper, not so much in the illuminants used that the paper is not much in the illuminants used that the paper is not much in the illuminants used that city. The fault pericularly noticeable in American cities in the lack of careful discriminantion better which domand considerable light and those which are perfectly illuminated with a less under the light and those which are perfectly illuminated with a less under the light and those which are perfectly illuminated with a less under the light and those which are perfectly illuminated with a less under the light and those which are perfectly illuminated with a less under the light and these lights are the light and light and the light and light and light and light and light and light and the light and li streets which demand considerable light and those which are perfectly illuminated with a less causity of light Most schemes of lighting aim at an approximation to uniformity of illumination over its whole area of the city, whereas, its quantity and character abould rather be determined by the particular character of the streets in which it is prized. The main thoroughtanes, in which there is considerable night traffic, should receive an amount of the contract of the streets of the considerable night traffic, should receive an amount of the contract of the considerable night traffic, about receive an amount of the contract of the c to enable the people to get about comfortably Sc also, a third class of streets, lying more remote and coming under the head of suburban roads, require ther method of illumination. Since the funds yet another method of illumination since the luminous mental purpose of lamps in the outlying, little-used streets, is to serve as markers of the way, the using of very large units, widely spaced, is obviously improper, a better way would be to employ small units located at shorter intervals.

The principal streets of American cities, according to Dr Bell, as a rule are poorly lighted, the secondary streets are lighted sometimes better and es worse than they should be, and the class usually have one lamp in every long block, which is useless, except within a comparatively short radius, for such purposes as facility to the red house or reading the address in a note book. As to the absolute amount of light required, the control of the should be red to the should be red to the streets one should everywhere have enough light to read a paper by, which is the standard of illuminate cities of Singland and continental Europe. Singland and continental Europe States is chargeable to the method commonly en the standard of the standard of the standard of the standard between the standard states is chargeable to the method commonly en large the standard of the standard between the standard way between the standard way between the class usually have one lamp in every long block,

plan is to measure the light half way between the lamps with the photometer disk held normal to the amps with the photometer disk need normal to the ray, and, naturally, the tendency of competitors for the lighting contracts is to secure the specified mini-num at as low a maximum as possible Indeed, certain types of illuminants have been deliberately specialized for the purpose of giving two-hundredths or three-hundredths of a foot-candle at a distant ree-hundredths of a foot-candle at a distant Now, if these illuminants had been designed point. Now, if these Huminanta and noon communes as they should have been, not to give a special form of Illumination, but to give the best efficiency of which they were capable, it would be possible to make then light not only widely distant parts of the street, but the whole street. While it is not desirable to attain to uniformity with a low average of able to attain to uniformity with a low average of light it is equally underlinible to concentrate the light at certain points separated by long stretches of comparative darkness Summing up, the important points to bear in mind are, first, that streets are lighted for the people to use, second, that the streets are should be lighted with reference to the particular should be lighted with reference to the particular should be lighted with reference to the particular should be lighted with the second that the streets about the second particular to the second particular to the second particular to the second particular to the lighted than is customary in the littless distort today.

## A BATTLESKIP FLRET IN BAUK OCEAN,

OR many years our Navy Department has fol-lowed the policy of concentrating an unusual-ity large percentage of the total displacement of our ships in battleships of the first class.

It is a strict the second of the total captacement of the total captacement of the total captacement of the second of the second

Stranger is the time of a second to the passion of under his ope and immediately within reach. Principally no ship will be out to commission or pin peters, and when the resents are in the yeard for one; healing, they will have an servire A full complement of men as possible, no battleiship even being affected to paided 35 men—a torce which would be safficient to maintain the ship in condition to go into a property four hoursy notice. The large discount of the property of the p delphia, and the armored cruiser division at the

If the present plans are followed the batthaship feet in the year 1911 will be made up as follows: First Division, dasable "Connecticut." and the first readmonates "Florida." "Unit." Delawars, "Novia Dakota," and "Michigan" Second Division, the dreadmonate "Michigan" Second Division, the dreadparter of the "Connecticut" dans Trind Division, the four siture at the "Connecticut" dans. Trind Division, the four siture at the "Connecticut" dans. Trind Division, the four siture at the "Connecticut" dans. Trind Division, the four siture at the "Connecticut" dans. The division can be at the siture at the "Connecticut" class, the sister ships "Michigan" and "Micho" (armaler "Connecticut"), and the sister ships "Malon" and "Micho" for armarred crutiers division canadating of the four armored crutiers If the present plans are followed the battleship division consisting of the four armored cruisers "Tennessee," "Washington," North Carolina," and "Tonnessee, "Washington," North Carolina," and "Montana". In the year 1912 we shall have sufficient battleships to provide for a fiset in extreme enviree, constituting of twenty-ness battleships and a Reserve First of sleven of the older battleships of the first division of the active fiset was consistent on real transportation of the active fiset was consistent or of the older battleships of the first hard strength of the constitution of the older first seed to the first hard division, of the first washing "Carolina" for vision, of the first vessels of the "Coopgia" class of the Tonnessee" and "North Carolina" four abigs of the "Tonnessee" and "North Carolina"

ciass.

Our readers will recognise at once that in the above organization, ships of the same gaseral type have been assembled in the same division. The largest reason will dock at the Now York and Nor-

above organization, ships of the same gasteral type heave been assembled in the same division. The largest reasons will dock at the New York and Norfolk yards, where the largest drydocks and the best ficilities are to be found. ## ELECTRICITY.

a recent meeting of the Electrical Club of Chi-it was brought out that there are three thou-storage battery automobiles in Chicago. There more morage battery automobiles in Chargo. There are thirty-three storage battery installations in the city with an output of 47,000 kilowatts, while in New York the total output is 87,000 kilowatts.

An old barge has been equipped with electric weld-ing apparatus at Gothenburg, Sweden, to be used in repairing the boilers of steamers. The equipment conrepairing the botters of steamers. The equipment con-sists of a De Lawit turbine and two direct-corrent gen-erators. The current is conducted to the atomore requiring repairs by means of a pair of cables, and work can thus be sone within the botters with power generated on the bargs. The bargs is also fitted with a workshop where small repairs may be made.

An enterprising newspaper in South America in about to install a wireless telegraph system at its main office. This will be the first wireless newspaper office on the continent. The paper we refer to is La Pressa, of Buenos Ayres. This Argentine Republic is going to celebrate its hundredth anniversary with an exposition this year, which opens on May and La Preuse expects to keep in "wireless" with the exposition grounds

A Fresch inventor, M Paul Jegou, has devised an electrolytic detector which operates without the use of a battery to affect telephone receivers. The detector consists of a giase one containing at the bottom as small amount of mercury with some power (in its assultance of the content of the wire. Disuse suspanire action is used for the electronized The detector is found to act like a small battery, and yet possesses all of the sensitiveness of the electrolytic detector. One of these detectors used at Paris was found to receive signals sent from the Ouessant post on the coast.

Considerable attention has been directed of late to the effect of sunlight on the transmission of Herrian waves. A writer in Electrochemische Selfschrift, in commenting on this subject, points out that the stronger the aunahine the less the conductivity of other to the Herrians waves, so that it is incorrect to ener to the Hertailan waves, so that it is incorrect to speak of a wireless telegraph station as having any definite range, for one which has a large radius of communication in northern latitudes would have a much smaller radius in the tropics. This would be much smaller radius in the tropics. This would be particularly noticeable on vessels sailing north and south, and he suggests that it would be desirable to prepare a "radio-topographical" map, giving the rela-tive conductivity of the other at different latitudes.

A comparison of the inclosed are and the intensified are for indoor lighting was recently presented before the Minnesota Electrical Association convention. It was shown that because of the large carbons used in was move that occause of the large carbons used in the inclosed are, the carbons being half an inch in diameter, the are is spt to wander along the edge of the electrode, so that instead of giving a uniform dis-tribution of light, the light is greater on one side of the lamp than on the other With the intensified are lamp, there is no wandering of the are. The electrodes are much smaller, consisting of two upper elec-trodes are much smaller, consisting of two upper elec-trodes a quarter of an inch in diameter, and a lower one three-eighths of an inch in diameter. If the same amount of current is passed through this lamp as through the inclosed are lamp, the electrodes will be heated to a higher incandescence, thus giving a greater and steadier light.

The Board of Underwriters of Ohioago has issued the following requirements for wireless telegraph in stallations. Arrial conductor must be at least No. 3 B and 8, gage rubber-covered wire non protitous insulators on exterior of building and or knobs, cleats or in moiding in interior of building around the second ings to be used through walls, partitions and floors. Aerial conductor must be permanently and floors. Aerial conductor must be permanently and effectively grounded at all times when station is not in operation A Artial condension must be permanently and effectively grounded at all times when station is not in operation by a condensor not smaller than No. 2B. and S. gage that the second of th

### SCIENCE.

Da a recent number of the Astronom Nachr. C. Carakit calls attention to a new variable star or nova, fromed on a piate taken March 1874, 1990, at 100 dm. to 13h. Mon (Monow Insentine) The image was found in a position that was vasant on 44 previous plates, showing stars down to 135 magnitude. The stars approximate position is a = 35 mm 5s. 8 = +35 approximate positio deg 50 min (1900)

G. A. Campbell recently conducted some experin investigate the subject of teleph to investigate the subject of telephone intelligibility.

In his experiments, usually only detached syllables were employed, so as to give the listener no cine from the context. The syllables easy to inter-change are right in about half the cases. Thus while it is obvious that the telephone seriously distorts aposer wares, nevertheless, even those consonants which nearly resemble each other are not sufficiently distorted to. semble each other are not sufficiently distorted to be indistinguishable

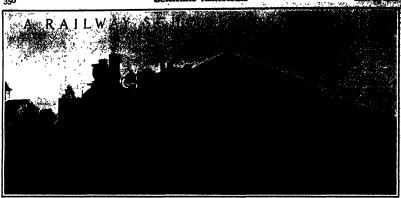

A good photometric measurement of the brightne of the nucleus of Halley's comet was obtained on April 21st by Prof Wendell at the Harvard College Observa-The measured magnitude of the nucleus was 64 The total brightness of both the nucleus and the sur rounding coma was a little above the fifth magnitude. With the approach of the moon toward the rein the sky in which the comet is found there will be very little to repay the early riser. In fact while the comet is in the eastern sky

From a study of the radio-activity at the earth saurface, made by G A Cline, it would seem that the soli contributes by far the greater proportion of the penetrating radiation present at the earth's surface at Toronto, and by comparison any that may have its source in the atmosphere or in the sun may be considered to be negligible in amount. There are no regular diurnal maxima or minima, but there are changes from day to day which seem connected with concurrent barometric changes. The conductivity is greater when the ground is baro and warm than when it is frozen and covered with snow. Filtering air through cotton-wool still leaves many suspension particies

A letter has been received from Prof E B Frost. director of the Yerkes Observatory, at Harvard Col-lege Observatory, in which Prof Frost records recent observations of Halley's comet. He found the comet observations of Halley's comet. He found the comet more conspicuous than the adjacent star Pascium, and Prof Barnard estimated the nucleus which was not stellar, to be two magnitudes fainter than this star On April 14th the comet was photographed with six minutes exposure No tail was visible with any six minutes exposure No tail was visible with an of the instruments. Visual observations of the spectrum were made by Prof Frost and Dr Sle trum were made by Fror Frost and Dr Slovin, and showed a distinct continuous spectrum from the nucleus No bright bands or lines were seen. The intensity of the continuous spectrum relative to the emission bands, has greatly changed since the comet was visible in the evening

Some idea of the enormous amount of labor required to extract radio-active substances from their ores may be gained when it is considered that to obtain two milbe gained when it is considered that to obtain two mil-ligrammes of substance containing of milligramme of polonium, it was necessary for Madame Curic and A Debi-rme to treat several tons of uranium Fairly pure helium was isolated from the gases given off pure helium was isolated from the gases given our by a solution of polonium under a high vacuum in a quarts tube, due to the action of the alpharays emitted by this element. The life of radium is about 5,300 times that of polonium (which is reduced to one-half in 140 days) The spectrum is being studied one-half in 140 days) The spectrum is being studied with a view to ascertaining if an inactive element is derived from it, polonium according to theory, being the last radio-active term in the series of derivatives from radium. The atomic weight was estimated to he shout 200

A new preparation has appeared which cleans and polishes silver, silver plate, nickel and other white metals, and which is said to produce a plating on pur-silver and any metal except gold by mere contact of silver and any motal except gold by mere contact or the preparation with the motal in view of the pub-licity given lately in British seientific journals to a similar preparation invented by Rosenberger it is in teresting to note that the American article has been known in the United States for several years although offered more prominently only since 1908 Rosenberg er's preparation requires a different modification for er's preparation requires a different modification for cach metal. The American preparation is a white, creamy liquid, perfectly stable and unaffected by light, and is claimed to be perfectly free from mercury, solds and other injurious ingredients. So far as we are able to determine, its plating action seems to be due to the affinity which the motal to be plated exerts due to the affinity which the motal to be plated exerts upon the molecules of alliers in the solution, so that the resultant plating is identical with that produced by ordinary dynamic electroplating. No electric cur-rent is necessary to produce the plating nor is an ad-dition or admixture of any other gubstance required.

Demonstration train at a way station in California.

In response to an urgent request from leading dairy interests in Southern California, Prof Leroy Anderson, head of the dairy department of the California College of Agriculture, has just made an examlation of the milk conditions in that part of the

Prof. Anderson agrs that in consultation with the datyrmen, it was devided to langurarie a good adayrmen, it was devided to langurarie a good and the referro of many conditions now undestrable in the methods of producing milk, can better be reached through the commercial aspect of the business and through the commercial aspect of the business and through the education of the producer and the counter than through drastic and radies! significant

He says that he finds the conditions under which thilk its produced about Los Angeles are not materially different from conditions in other populous centers, except that nature is possibly kinder in granting more sunshine and less rain and a more porous soil, all of

execute management of the management of the which then thought of the management of the which then thought on management of the management

In cities like Los Angeles and San Francisco, he says, where large wholesalers act as distributing agen clos between the producer and the consumer and pasteurize all the milk, some of the dangers that might result from disease of the cow and uncleanliness are obviated

"it does not have a pretty sound," continues the professor, "to say that lack of care on the part of the producers is partly the reason for the expensive pasteurisation which the wholessiers now give to milk."

"Tasteurisation, however, is one of the advance steps toward a healthier race, and some day this process will give way to such clean methods of producing milk that it will not be necessary. That is the gual toward which we are all striving."

ing "It costs money to produce clean mith, which cost must be not by a higher selling price or by more profitable cows, or both. The cow sepscialty is our mind just now, and we call the reader's attention to records taken from different bow cows vary in returns to their owners are not might be consens from similar outlay for food or seen from similar outlay for food or seen from similar outlay for food

Prof Anderson then refers to the subject of proper stables and corrais for dairy cows and says

"The great thing to be desired in either, in that hiver should be easy meaks of keeping clean and then keep these clean. This is the chief reason for using concret in stable floors. It doks not decay and then cause frou bdars, and it can bessed down with water and sweep in a few moments, so that no dirt remains. Some dairymen object to cows standing on concrete, but in California, where the cows are in only for feeding and military that some no laters.

in Casifornia, weare the cows are in only for recently and milking, they suffer no injury
"Occasionally a very good stable is constructed where the cattle stand, which portion is made of plank This works well from a sanitary point, if the planks are water-tight or are understail with a water-tight outset, and the sanitary point, if the planks are water-tight outset, and the sanitary point, if the planks are water-tight outset, and the planks cannot become saturated

monotonic activates in sheolitely essential to the production of clean milk. Milling in the certail is an abountation, either in winter or in summer. In win a shoultantion, either in winter or in summer. In win er, during the retain season, it is not uncommon to see both cow and miller wading nearly to the knees to mid, when of necessity the milk must become the depository for some of the mid.

"In summer, when the corral dust may be from one

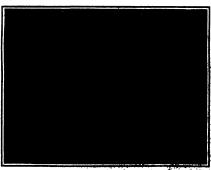

in summer, when the corrat dust may be from the tofur lacked deep, the condition is seen worse. The dust is raised with any slight breeze or with every movement of man or best, and even more dirt finds its way into the milk than during the time of rain and mud. Thus the cows must be provided with some stable which is dry and clean, and where they can be held for milking.

nts. The most resemblance to these is shown by placenta. The most resemblance to these is shown by the grains of barley, the addition of which is ascer-tained with a satisfactory degree of certainty from the precipitate on the slove A quite customary adultera-tion of bread is effected with rice flour, which always

fails to escape the scrutiny of the microscope when fails to seeape the scrutiny of the microscope wasu-this is invoked, for the grains of starch of rice are always left in great number on the sleve and are more easily recognised because during the preparation of bread they aufer less change. This result of M. Col lin's investigation is extraordinarily important, for the addition of rice flour to wheat flour or to rye flour has begun to be a veritable torment Besides, certain kinds of corn meal have been misused in the same way, though easily detected by the micro

way as is seen in the usual blades, and in this way a

way as a secen in the usual blades, and in this way a wide swath is cut under water and at any desired height above the bottom. The paddie wheel is carried on a frame which is adjustable by means of boils, so as to give the paddies any desired immersion, and the gasoline motor drives the wheel by gwaring and chain device, using two separate countershafts for this pur-

## REAPER BOAT Α

## BY THE PARIS CORRESPONDENT OF THE SCIENTIFIC AMERICAN

A French constructor, A Amiot, has brought out a type of boat combined with a set of cutting blades, which is designed for sen in cutting off squate growths water courses. Such operations are often becausery where the bottom of a pond or water course becomes obstructed by the thick growth of squatte plants, but where it is required to be carried out by hand above the bottom of a pond or water course becomes the bottom of a pond or water course becomes the bottom of a pond or water course becomes the bottom of a pond or water course becomes the bottom of a pond or water course become the bottom of the bottom of the course of the bottom of A French constructor, A Amiot, has broug an internal combustion motor mounted on a boat, and the motor serves to drive a set of cutting blades, which are designed somewhat after the fashion of reaper blades and adapted in their form so as to carry out the cutting of the plants under water in the best man ner The best is rather narrow, and flat bottomed being much narrowed at the front and the rear In the front is carried a paddle wheel, which is run by gasoline motor, which

Its total length is

about 20 feet.

The cutting bars are mounted at the lower end of a vertical frame, which is held at the rear end of the boat, and these extend transversely across the bottom of the frame so as to lie at a point near the bottom of the water course or pond and to cut off the plants as the boat ad-vances. Such bars are made in different longths and also at different curva-tures so as to be adapted for flat bettoms or for beds of streams of different forms and sizes. The bare are usually from 6 to 12 feet in length, and are de-signed to cut off a courid-erable area at a time. This edged to cut on a wave very constant of the present system as the present system as great derivation in the first his or correr a loss that the present system as the present system and the present system an

being swung upon the end of the lever, which is ob being awaing upon the and of the lever, which is ob-served at the upper part, and this lever is prioried in an upright. By means of the counterweight at the old of the lever, the entire frame can be raised and lowered, and this gives the adjustment of the cutting bars at any desired height in a convenient way. The gasoline motor is pisced at the other sed of the beat, and there is a belt transmission running to the rearend, which operates the pulley placed in the upper part of the cutting bar frame This does not inter fere with the raising or lowering of the frame, as will be noticed, seeing that the belting and pulk ys can work at different angles. On the shaft of the pulley is a crank which drives a rod, and this last passes down along the frame to the lower part, where it con nects with a rack and pinion movement. By means of the alternate up and down movement of the rod, and the rack and pinion at the lower part the cutting blades are given the to and fro movement in the same

pose so as to give the needed speed reduction. The gazoline motor is operated at the standard speed of 500 revolutions per minute. When it is required to take the boat into shallow water or otherwise to passe over rocks or other obstacles, the cutting frame can be lifted entirely out of the water. In this case the cutting bars are folded up along each side of the frame so as to occupy but little space the cutting is carried out at the glum It is also used on

The upper view above teaper beat is operation. The lower picture is a plan view showing

In usual practice so as to occupy but little space. In usual practice the cutting is carried out at the rate of 1½ miles an hour, and the cost of operating is estimated at 80 25 per mile, comprising gasoline, oil, labor, together with depreciation and maintenance. For cutting one acre area, the cost is figured at \$2.70 The Amiot system is meeting with great success in Europe, and it is now in use on the artificial lakes of the domain of the Institute of France, at Chantilly, and also on the domain of Lacken, belonging to the King of Bel

> a number of canals and rivers in France According to the Elec-trical Review and Western Electrician, the Park Building at Pittsburg, Pa., which is 15 stories high and contains 490 offices, was recently lighted by carbon flament lamps and had its interior decora-tions painted a deep sea green color It is now lighted by tungsten lamps, and has its interior paint ed a light buff color replacing 8,910 carbon replacing 3,910 carbon lamps (56-watt) by 780 100-watt and 200 25-watt tungsten lamps, and 21, 840 watts in 16 and 32 candle-power (arbon lamps by 8,400 watte in 40-watt and other tungsten lamps, 149 4 kilowatta is saved.

### THE REPARTOR INSTALLATION OF THE METROPOLITAN LIFE TOWER.

In the newly-completed Metropolitan Life Is In the newly-completed Metropolitan Life insurance tower is to be found an example of an installation which serves the purpose of lifting cars to an alti-tode greater than that attained in any building yet constructed Judged independently of its height. the installation is a model of modern elevator engiring Furthermore, it is significant of the st necting ruttnermore, it is significant or the success-ful development of a comparatively recent type of ele-vator machine which has been tested in actual use and found to answer the requirements of service as well as the requirements of mere height Great as the lift is the designers claim that it is possible to go even higher and that elevators can be installed in any skyscraper which the ambitious architect may yet easay As a result of this engineering achieve ment there is no difficulty in renting offices far above the city's noise and dust. No more time is consumed

or the Metropolitan Life tower, the type of ele vator selected was the Otia traction overhead machine, in which the motor and driving sheaves are situate in white the moor and driving showers are accessed directly above the hatchway. High up in the aper of this white marble campanile are to be found powerfu! electric motors, whose installation at this elevation taxed the ingenuity of the architect and engineer. They are without doubt the highest motors working in any building

thing the 44th story of the Metropolitan tow than the 12th floor of older buildings.

The problem of high rise in a tower building is one that can be solved by but few types of elevators 400 feet marks the limits of the plung A height of 400 feet marks the limits of the plunger and other hydralic machines in many forms of electrical elevators the weight of heavy moving cables or other parts, and the exact regulation of the car or load, are difficult if not impossible of attainment when certain heights are exceeded in the Otis system illustrated we have a simple machine that has been found to work with ease, safety, and reliability A motor is mounted at the top of a shaft or hoistway The armature shaft carries between its two bearings a driving sheave around which the six cables suspend ing the car are passed One end of the cables extends to the car, the other to the counterweight, which to the ear, the other to the counterweight, which moves up and down in guide rails at the side of the shaft, and is equivalent to the weight of the ear and its average load Directly below the driving sheave is ditted an idler sheave, around which the supporting cables are inlid, so that it passes again around the driving sheave with which it is in centact for two half-turns. When the current flows through the motor, the armatum rotates and moves the car up or down as desired. When the current is cut off powerful automatic shoe brakes are applied to hold the driving sheave A compensating cable in older installations a chain is connected with the bottom of the car, extends to the bottom of the shaft, passed around sheaves or pulleys, and then extends to the counterweight Its object is to compensate for the counterweight its object is to compensate for the weight of the supporting cables, whether the car is at the top or the bottom of the shaft. In other words, the system is very nearly in equilibrium, and the function of the motor is merely to move it with such additional load as is supplied by the passengers in the cars. When the Metropolitan installation was con-sidered by a board of elevator engineers it was re-alized that this system was the only one that would meet the conditions demanded in an office building meet the conditions demanded in an office building of extreme height. The thorough tests which the machines have received since their completion has justified the engineers in their selection. The Tower installation, which is quite independent

of the elevator systems serving other parts of the huge Metropolitan Building consists of six express elevators, which make no stops between the street and The cars are arranged in the cente of the tower in two banks or rows of three each, five of the six running from the 1st to the 41st floor, or a rise of 524 feet 111/4 inches. The middle car on the east bank runs from the basement to the 41st floor, while the middle car in the west bank runs from the bussment to the highest landing in the tower on the 44th floor, a distance of 586 feet 514 inches. With a live load of 2,500 pounds, or about 16 passengers, the cars can make a speed of 600 feet per minute without stops, which is the maximum permitted by the p New York Building Department regulations. New fork Building lepartment regulations. I has the journey to the top floor consumes but a few seconds under a minute which is recognized as about the limit demanded by office building renting conditions. The actual consumption of time by the passenger The actual consumption or time by the passenger does not place the tower building at any diadrantage over lower buildings, where allower speeds and frequent stops may require the same expenditure of time. In this connection it may be remarked that the traction machine illustrated can accelerate from a step to full making its from two to three seconds smoothly to full make the content of the same of the content of the content of the same to full speed in from two to three seconds m and evenly, so that the passenger experiences no un-pleasant measured in expected to travel up, and down

daily a total choices of 25 to 5 miles.

of the engineer restricting content in the process of the new content of the process of the new content of the total of machinery. rator installation was not a final finit

Mevator installation was not a final feature of the construction of the tower, but an ever-present condi-tion. As fast as the structural workers completed the tion. As that as the structural workers completed the framework, the rails for the care were set in Mass, and a temporary obvasior was rigged to send up the materials of construction. As the materials for the five machines for the elevator running to the first machines for the elevator running to the first force could be curried up by the high-rise elevator, that erection was not so different a matter When it has come monomers to raise the matchine for elevation of the case monomers to raise the materials for desirable and came necessary to raise the machine for elevator no. It up to the 64th enory, a serious problem was present. Restaully, the test was accomplished, and the huge cartings and armature were sent up to a point where they could be set in place by an ordinary tackbar of from and \$5.00 pecusia such for two elevators where devices are employed to enable extra fleavy loads, such as area, to be relaised. The magnet controllers weigh \$5.00 and \$3.00 pecusia respectively for the two classes of machines. It is here that the operation of the switches governing the motors one-controllers which are not to the controller than the controller whether are not to the controller of the switches governing the motors one-controller which are not one to the controller of the switches are noted to control of the switches are noted to control of the switches are noted to control of the switches are noted to

The motors are rated at 40 horse-power and use its voite direct current. They run at a spend of from 55 to 18 revolutions per minute, and the peripheral society of the driving sheave on the arranture shaft gives the speed of the cast. The limited space in a time of the speed of the cast. The limited space in a time of a large peripheral space in the control of the speed of the cast. The limited space is a state of the Husdon Terminal, where the traction machines can be arranged in orderly rank. In the tower one machine may have to be pinced shows the total control of the space in the controllers and other auxiliary named to the controllers must be fitted in wherever a piace offers. Consequently, the methicary round for the tower has a low without particular spaces and the space is with the controllers of the tower has a low without particular spaces and the space is with the controllers of the tower has a low without particular spaces and the space is with the controllers of the controllers of the controllers of the controllers of the space is with the controllers of the controle The motors are rated at 40 horse-pow

Around the driving sheaves pass the lifting and counterweight cables, six in number for each nichine. They are % of an inch in diameter, and ea chine. They are % of an inch in diameter, and earn cable has a breaking strength of 20,000 pounds. The length of the several cables for the various cars varies from 576 to 625 feet for the high-rise car Another important cable is that passing through the car to the eentrifugal speed governor at the top of the hatchway These are ¼-inch cables, and they vary in length from 1 144 to 1,274 feet. Their function is to transmit the otion of the car to the centrifugal gove in case of excess speed not only cuts off the power, but causes the safety device of the car to come into play and lock it firmly to the rails. The cars, which yeary and sock it minity to the rails. The cars, which vary from 9 feet 4 inches by 8 feet 4 inches to 5 feet 4 inches by 8 feet, weigh about 4,000 to 4,500 pounds each. The counterweight is slightly heavier than the empty car, so that the car is assumed to carry an aver-

In the more recent Otis traction elevators, the clanking chain used to compensate the weight of hoisting and counterweight cables has been supplanted by a special flat wire rope, which is 3% inches wide and % of an inch thick, one end being attached to the bottom of the car and the other to the bottom of the bottom of the car and the other to the bottom of the counterweight This cable passes over flat finanged sheaves, arranged in a channel-iron frame at the bottom of the shirt, which frame is carried in such a way that the sheaves are free to more up and down as the holeting poss sirethed recutrant. Two of these compensating cables are attached to each elevator, their length varying from §76 to \$400 feets. Safety no less than speed is insured for these graves elevators. Thus the speed governor already referred to serves to actuat a wedge-tung derice on the car, and to limit the speed electrically to 700 feet.

ferred to serves to actuate a wedge-clamp device an the car, and to limit the speed destrically to 700 feet per minute. If a speed of 200 feet per minute is reached, the wedge-clamp safely derice vories at once, and the car is clamped to the rails. Furthermore, each our has an emergency braite which enables the operator to shut off the power and clamp the our to the rails independently of the speed governor. At the top of the shaft, antery retarding devices cheft the speed of either car or countervalght in cases the ordinary limit of travel is exceeded.

## HALLEY'S COMET -A MODEL OF ITS CERIT.

For the large number of people now interested in the famous Halleys comet who have found difficulty in obtaining an intelligent idea of its motion in space its apparent motion in the sky and the times of its visibility a cardboard railof model like that of which a photograph is berewith reproduced will be of great amistance And even those who already understand the phenomena from the study of plane diagrams may obtain a much clearer idea of them from the model because it is much more concrete and represents the sun and the orbits of the comet and the earth as they really exist in space and not as they are often shown

y being projected on the same plane
In order that the readers of the Scirntino Ampai in order that the reacess of the SCHPHTHO ARFAI can may easily construct such a model for themselves patterns or diagrams are printed on the accompany ing loose-leaf supplement which when pasted on card board cut out and properly fitted together will make an excellent model

After telling how to construct the model so

scription will be given explaining how the astronomical phenomena may be studied from it

Having first pasted the loose-leaf on a sheet of card
board about 10-pty cut out the three diagrams along
the dotted lines Also cut a narrow slot through the planes of both the comets and earthy siot through the planes marked. Then insert the planes into each other as far as the alets will allow keeping the earth s orbit below that of the comet on the right but above it on the left.

If the two planes are correctly fitted together they will now produce the general effect shown in the pho-tograph. But besides having the model rigid the two planes must be given the necessary inclination to each

planes must be given the necessary inclination to each other of approximately 18 degrees. Fasten the two planes together by pasting two enails mustals higges in the angle between them one on each side of the sun keeping the shots in line. Then bend ing over the flaps of the triangle along the two lines matted on it pasts it as a wedge between the plane of the earth a orbit above and the comets below. This

impletes the model

The reader will observe that the comets position is indicated at intervals of ten days before and after perihelion as it travels in its orbit in the direction of the arrows. The earth s position as it yearly moves about the sun in the opposite direction is also shown for the same days. The printed side of the model

Examining the comets path in space we see that

Examining the counts path in more we see that it cats through the plane of the ellottic at the according node symbol & in Assuary On April 19th it was at perhelic On May 18th 19th it cuts through the plane of the eclipte at the descending node. During the early part of the year the cenus and the sarrh spored on roughly parallel lines. Hence the counts givey brighter only by a change is its intrinsic facilitatory. Now however the orbits are rounding in the threat side other and the counts will be more conspiguous became it is approaching the earth 7ths tail is always directed sway from the son Happe in March it was much foreshorized for us fixed it is the bright of the proposed that is the country of the son that is the same than the same than the same that the same than the s

The time of visibility of the comet will depend on whether it is to the left or right of the sun as seen from the earth To transfer correctly to the sky left and right on the model we should imagine the sun on the meridian at noon with the comet to the left or on the merician at poon with the connect to the left or right. Taking the way that common observation shows the sun to move across the sky from east to west on account of the earth a fally rotation it is easy to see that any body that is to the left of the sun at noon will rise and set later than the sun and anything to the right at noon will rise and set earlier than the sun

than the sun Hence before March 25th the comet being to the left of the sun rose in daylight but set after the sun and was visible in the evaning At present it is to the right of the sun and rises before it in the mora ing increasing its distance until May 8th when it reaches its greatest western elongation. It then ap-proaches the sun and comes into inferior conjunction on May 18th 19th

As the three colestial bodies are also in the same plane on this date the circumstance makes it possible for us to go through the comets tail if it is long emough to reach us What we shall see on that night it is not the purpose of the present article to con sider but it may be said that as the moon is then sching full a fact which has been some

overlooked we may not see anything at all The comet and the earth are fourteen million miles distant May 18th 18th but their closest approach on curs a day later when they are thirteen million miles apart The closest approach of the orbits is at a point a little below to the left where the counts orbit is six and one half million miles below the earth s On diagrams where both orbits are projected on one plane they apparently intersect at this point Hence some people have imagined a possible collision here but the orbits never intersect as the mod-

On and after May 20th as the omet is to the left f the sun in the model it will again be visible in the western sky being seen as soon as it is dark enough and setting about two hours after sunset which time will gradually increase 1 four hours by which time will gradually increase to four hours by the end of May. But as the two lodies are then re-ceding in almost opposite directions and the tail is turning more and more away from us the glory of Halley's comet will soon be lost to us for three-quar tors of a entury

## Mercury Are Patents Granted

After six years nest Mr Peter Cooper Hewitt has been awarded patents for his mercury vapor elec-tric lamp. The patents have been in interference st since the date when they were first as piled for 01 Mr Hewitt's chief opponent was the General in 1901

In accordance with the recent decision affecting th classification of articles under the Lariff Act of 1909 the United States Treasury Department has instructed customs officers to admit free of duty all miners safety lamis whether elatric or designed for usi oils or other illuminating materials with or withou oils or other illuminating materials with or without giasa chimneys and whother imported as an entirety or in separate parts together with any apparatus for locking or unbotching such astrol; lamps for testing or desecting naws in these lamps or for desaning them of dust particles et together with all mir a rescu-appliance and parts thereof such as bein it specific tubing of vilves special oxygen sylini in offiling oxygen pumps and all other essential parts of the complete putilt, whether imported as entireties or is

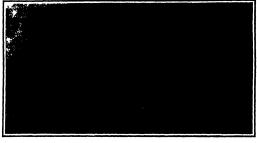

# MOTOR-BOAT RACES AT MONACO THE

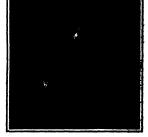

BY THE PARIS CORRESPONDENT OF THE SCIENTIFIC AMERICAN

The motor best races at Monaco at The moor bout races at means a an about. Carlo this y as we notworthy on account of the extremely high up of a bith was attained according to the cable dispatches. There were a score or more of beats in the races which were tavored with excellent weather

and a half astonished many of the speciators, and was an excellent testimental to the design and con struction of the Wobselry-Siddelsy motors that drave her She was piloted by her owner who steemed her with great steadiness. He took the turns with-

gree of accuracy is obtained, and an experience has shown that in a long-distince race a lengt will make the support of anything, thus in a short speed trial, it seems certain that the Ursula' has not shown much more than 46 miles as hown so far That she should

Three of the centestants making a turn in the "Championship of the Sea" race

Stern of the "Ursula," showing radder and twin sore

that made possible the attainment of great speed sp-inity in the long-distance events. The flust long-distance revents the flust long-distance race for the Championship of the flew was held on Sunday April 10th Count of Purviates Coorcive resulty were this 10th-disenter (144-mile) race in 4 hours 28 minutes 45 % 5 sec. code at a speed of 281 miles per hour Out of the 28 competiture in this long distance race for cruisers the Tel-Morra Calpuso Gregoriev VIII and Spagal linati finished in the order given 11 ne was an exciting one assevani of the boats

ii in e was an exciting one as several of the boats were quits evenly matched. The Brasier Despujois hydi plans which was one of the novel craft that iscal this year did very well and showed good speed in projection to its horse-power. In the second great in proportion to its horse-power. In the second greated international rev. for the Coupe des Nations which tooks place on April 12th this book was second final place on April 12th this book was second final place on the complete of the 100 kilometers (821 miles) in 1 hour 2 de minutes 80 25 seconds 25 miles) in 1 hour 2 de minutes 80 25 seconds 428 miles an hour of the Urrusia. She was final revealed with a Breater 4-cylindow-negation of 100 horse-power with the 100 horse-power with the 100 horse-power with the 100 horse-power with the 100 horse-power hourse-power. One of our photographs shows the twin acress of the Urrusia. Her capture are arranged side by side one on each side of the built Another photographs shows the Urrusia at 111 mg and while a latired it ture shows the Brauter buil Another photograph shows the Ursula at Juli n, vd. while a third it ture shows th Brasier Despuisle The difference in the amount of spray thrown by these two beats is interesting the former cuts through the water with very little disturbance while the latter shims over it with a good deal of spisating Tu, guart; sufarity with which the Ur-sula speeded around the course for nearly an hour

out slowing down and at each turn the boat would tip dangerously. The Ursula showed herself to be one of the fastest motor boats that have ever been built but in the mile and kilometer speed trials she did not make anything like the time that rams me cut not make anything like the time that she is reported to have accomplished in the long distance races in fact the hydroplane beat her in the speed trials owing to its ability to get under way quicker. The times of the mile from a standing start and of the flying kilometer trials by the Brazier Do-pujois and the Ursulia were as follows

|                   | Mile     | Kilometer         | Miles<br>an Hour |
|-------------------|----------|-------------------|------------------|
| Braster Despujols | 2 20     |                   | 35 71            |
| Brasier-Despujois |          | 50 2-5 sec        | 44 25            |
| Ursula            | 2 36 2-5 |                   | 20 00            |
| Ursula            |          | 55 <b>2 5 sec</b> | 40 80            |

The Ursula this year is fitted with the same two 12-cylinder Wolseley Siddeley motors that were used last year. As her best speed then was about 37 miles per hour it is fair to assume that the figures given in the cabled reports are not correct or else that the distances around the course were less than supposed it is extremely doubtful if the Duke of Westminsters racer averaged more than this figure in the long races especially since she made only 40 35 in the long twee especially since see misus only we on miles an hour in the flying kilometer speed trial We understand that on account of the great depth of the water where the races are held there is often times a shifting of the buoys owing to the inclining of the anchor lines and that this causes a shorten ing of the course. The mile and kilometer tests are therefore the only ones in which any great de have averaged 48 miles an hour with the same power plant as heretofore is very creditable

# An Aeroplane Flight with Five Pure Cross-Country Flying in France

One of the most remarkable performances ever made rith an aeroplane was that of Roger Sommers new with an aeroplane was that of Roger Sommers nev biplane last week in France when piloted by its own structor it carried him and four other persons in a five-minute cross country flight. On this occasion the aeropiane lifted some 750 pounds of dead weight probably a total weight of 1 800 pounds with pres

per minute. The cylinders are set with steel blades, parallel to the axis, and the plate bears a number of steel blades, slightly inclined to those of the cylin dors The finely ground nitrocellulose next goes to the bleachery, where it is treated with chlorine, hydrothe bleachery, where it is treated with chlorine, hydro-gen dioxide sulphurous acid, potassium permanganate and other decolorizing agents. It is then washed thoroughly, pressed between rollers, and dried ('cilculoid is made by dissolving nitrocelluloss in an

alcoholic solution of camphor Bome mix the camphor with the moist produ Some manufacturers presses which contains 40 per cent of water, while others add the camphor to the dried nitrocellulese in the former case the moist pulp, camphor and colorand in the control of the money of the many campaor and control of the many campaor and ca crushed by rubbing the pulp, with the hand ough a coarse wire screen

Drying is effected indirectly by pressing the pulp between layers of absorbent material. The pulp is spread on a cloth which is turned up over it, forming spread on a cloth which is turned up over it, forming a rectangular cake 24 inches long 20 inches wide, and about % inch thick. In the factory of the Société Industrielle du Celluloid these cakes are piled alternately with dry feits a sheet of iron boing introduced

after each ten or fifteen cakes, in order to facilitate handling. The pile is then sub-jected to a hydraulic pressure of about 250 jetted to a hydraulic pressure of about 250 tons. After a few minutes of this violent compression, the new wet felts are replaced by dry felts and the operation is repeated until the nitrocellulous is dry. The compressed eakes are new unwrapped and bucken into fragments for solution. If the campinor has been added before drying the habour lates a feet and the complete of the campinor has been added before drying the broken cakes are simply sprinkled with al cohel, but if the dried nitrocollulose contains no camphor it is moistened with a solution of 90 parts by weight of camphor in 100 parts of alcohol

The solvent is allowed to act for 24 hours and then the mass is rolled between hollow iron cylinders, from 12 to 26 inches in di ameter, which make 10 revolutions per min ameer, which make to revolutions per init ute, and are cooled or hested, as desired by a circulation of cold water or steam in their interior. From 65 to 130 pounds of celluiold are rolled at a time the rolling being continued from half an hour to several hours. Toward the end of the operation the cylinders are brought close togother in order to produce a thin sheet of celluloid longer and wider than the press by which the sheets are converted into The rolled she ets are trimmed the exact dimensions of the press, and the trimmings go back to the rolling mill In the Champigneul block press a strong

iron box 54 inches long, 26 inches wide and 12 inches high is filled with sheets of cellu-12 inches augn is mined with sheets of ceiti-loid and those are converted into a single block by pressing between two iron plates. The top prate is fixed in position, while the bottom plate is carried by a plunger which oners a cylinder below and is forced upward by hydraulic pressure A pressure of 250 tons is applied for a period varying

of 259 (one is applied for a period varying from 5 to 1.1 bourn, during which the ceilu loid is kept at temperature of from 156 to 1.9 deg. Py a circulation for 156 to water in the interfer of the plates and the double waits of the box. The mass is coded by substituting cold for hel water the pressure being continued during the cooling. The top plate is ther removed and the block of ceiluluid is forced out of the top of the form of the pressure forms being continued during the color of the pressure forms the continued during the color of the pressure forms the continued during the color of the pressure forms the color of the color of

The blocks are cut into bands or rods according to be purpose for which the colluloid is to be used The bands are cut by a machine in which a knife, the edge of which is inclined 40 degrees to the hor zontal, is forced downward by a screw In this way bands varying in thickness from 1/250 inch to 14/2 inch can be obtained. Celluloid is cut into rods or libers by a machine in which the cutting tool has the form of a whost cylinder of diameter varying accord ing to the size of red desired

The celluloid, after it is cut up is dried in cham the centilion, after it is call in direct increase bera where the temperature is never allowed to exceed 111 deg F on account of the danger of explosion. The time required for desiceation varies
greatly with the thickness of the bands or reds Bands
thinner than 1 100 inch dry in a few hours while strips thick enough to be used in making knife han dies, for example must remain in the drying cham her about six months.

Tubes of celluloid are made directly from the rolls sheers in an apparatus which comprises two vertical cylinders, with their axes in the same line and their pistons connected by a cross red. The bettern of the lower cylinder has a central critics, to which ass apertures of various dimensions can be adjusted, the lower part of the cylinder is heated by a cir tion of hot water. The calluidd is introduced like this cylinder and hydraulic pressure is applied by means of the cylinder above. The calluidd, settlened by the heat, is thus forced through the aperture is the form of a tube, which the operator draws away and cuts into convenient lengths by means of a champ of hot wate

attached to a cord passing over reversible pultays.

To return to the bands of calluloid which have bee To return to the bands of calluloid which have been cut from the pressed blocks. In the drying chambers these bands become warped. They are fistioned in a hydraulic polishing press which exerts a pressure of about 1,000 tons. The celluloid bands are pile nately with sheets of polished brass or nicks steel, a thick plate of cast iron covered with cloth or felt being inserted after each four or five bands. These felt being inserted after each four or five hands. Thus iron plates contain channels for the circulation of steam or cold water. While the presentre is applied of F for a few minutes and are then cooled by cold water. When the hands are taken from the pro-ting of the plate are found to have acquired the high points of they are found to have acquired the high points of they are found to have acquired the high points of the plate of the plate and the plate of high plate of the plate of the plate of high plate of the plate of high high plate of high plate high plate of hig sheets of metal which were in contact with them.

Before describing the subsequent transforms, the bands reds and tubes of celluloid, the method producing striped, veined, and marbled effects should

ges had a great amount of color so star images had a great amount of color surrouncing them. A less may be regarded as a round prism Since a prism not only deviates light but breaks it up into the spectrum colors, a simple less will act as is shown in Fig. 4, the violet light in most re-fracted and is brought to a focus at v, the less refrangible red comes to a focus at R, with rays of other colors in between these two extremes. The reother colors in between these two extremes. The re-sult of all this is that if we focus for the yellow, the red and violet form rings around this and a star image is aurrounded with a considerable amount of color Bir issue Newton was the first to explain these color Bir Isaac Newton was the first to explain these sherrations, and it is singuist that although he made experiments to prove that giass and water disperse tight differently, he did not forestail Dollard's discovery (180 years ago) of making an objective from a combination of two lenses, one a double context lens of graving glass, the other a double concave lens of graving glass, the other a double concave lens of fint slees.

filmt game.

With such a combination the optician has four sur-faces to figure, and as a result it is possible to almost entirely eliminate the spherical aberration, or in others words make a flat field. But on the other hand it is still impossible to get entirely rid of color Flint

Fig 4 -CHROMATIC ARRESTATION.

and crown glass do not disperse light alike, the fiint relatively gidens out the violet and the more. The optician with glass of two different sorts at his disposal can bring two colors of the spectrum to a sharp focus For a visual telescope the rays generally taken are the yellow and the blue green Consequently both red and the violet ends of the spectrum are not in sharp focus, and these form rings about the stel-lar image which combine to make purple color. In small telescopes this color is not so pronounced, but

small tolescopes this color is not so pronounced, but with large telescopes of 34 inches or more specture the color is complexous and cannot be got rid of This is known as the "secondary spectrum". The problem of making a good visual lone is really a much simpler one than that of making a good photo-graphic cas. In the first place, in the ordinary tele-scope for visual purposes, the field is comparatively readl, of only a few minutes of are, and the process of making a feed fist over the area is simple com pared with that required in an instrument like the Bruce photographic telescope of the Toreke Observa-Bruce photographic telescope of the Yewkes Observa-tory, which photographs an area in the sky 16 deg square. With refracting telescopes the ratio of aper-ture to focal length is about in the ratio of 1 15 (the Yerkes 40-inch has a focal length of about 750 inches, a ratio of nearly 1, 18). In a photographic telescope, of nearly 1 . 19). In a photo

Fig. 5.—COMBINATIONS OF LENGTS FOR RAPID PROTOGRAPHIC WORK.

for the portrayal of a comet, for instance, as short expansus an possible are desired, and this calls for me great a ratio of appearue to food length as been in the company of the company of the company of a ratio of appearure to feed length of 1 16 the lens is opened to 1 :8 the photograph is not so sharp. Only lenses of the best makes can be used at 1.5. (Fig. 5.) liveryone who is familiar with the tage of a cignose, known how much sharpes a picture is adjusted by religious of the company of the company of the religious to the company of the company of

field from a lens with an aperture of 1 5 is impossible with only two lenses; three or more are necessary Using glass of different indices of refraction which is possible from the fine qualities of Jenz glass now procurable, separating the lenses properly and now procurance, separating the interest properly and grinding their surfaces to the right curves, it is po-sible to obtain a flat field with an absence of color and astigmatism. (Fig 4.) The Bruce photographic tele-scope has an aporture of 10 inches with focus 50 inches It is a 4-lens combination, technically known

Every skillful amateur knows how to test a photographic lens. This is perhaps done as well as any other way by the test cards for astigmatism, to see

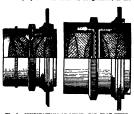

Fig 6 -- COMBINATIONS OF LENGES FOR FLAT FIELD AND ABBRICE OF COLOR.

if straight lines which intersect at right angles become lines or blurred images at the edge of the field. come lines or blurred images at the edge of the results for Still a lens might answer all the requirements for ordinary camera work but be a poor astronomical lens.

A camera might cut clear to the edge of the plate A camera mignt cut clear to the edge of the plain on ordinary work, but when a three or four-hour ex-posure is given on stars all imperfections will show up Unfortunately, for obtaining astronomical photo-graphs a telescope mounting with a good driving clock is indispensable—which is usually out of the reach of most amateurs

On the other hand there are a number of small vis ual telescopes in the hands of amateurs, and a few words night be said in regard to testing them This is best done on a moderately bright star. Forus car-fully on it. Push the eyeplece in slowly and note the change in appearance. If the spot of light does not rully on it I rush, the cycpiece in slowly and note the change in appearance I it he spot of light does not remain circular, the objective is not "squared or properly, or the objective may be pinched in its cell This must be adjusted before anything more is done Now pushing the eveniers in, the colors should

7 —WORE OF A RECTILINEAR LENS COMPARED WITE AN AWASTIGNAT BLURRING DUE TO ASTIGNATION IN RECTILINEAR LENS.

change gradually and symmetrically as the disk of light enlarges. The same should hold true by pull ing the expelce outside the focus. If the telescope behaves well from this test, turn to a double star like Castor. As the ameteur becomes familiar with the heavens, he will soon learn text objects for his telescope, and if he possesses a good instrument there is no keener pleasure than trying it night after night and becoming familiar with the beauties of the heav-

POWDER PLATING OF METALS. a mreting of the Royal Society of Arts, in Before a me London last January, a paper was read on an im-proved method of electro-plating. It described the process of plating metals by rubbing them with a moistened powder, and a number of articles were plated with gold silver and sine before the society. plated with gold suiver and sinc nerors the society. The new plating powders are not to be confused with plating preparations which have been in use heretofore and which act merely to exchange the surface metal of the article to be plated with a thin film of depos ited metal. In the new process a truly electroly-ic action takes place which results in the deposit of metal without taking away the surface metal from the object to be coated Furthermore the deposit may be made as thick as desired by continued applications The inventor of this plating powder of the powder of the powder and inventor of this plants; powder began his experiments a number of years ago with a view to developing a process by which kniven forks spoons and the like can be plated as rendily as they can be cleaned with polishing powders, and he succeed in deviating a workled by which almost any metal and even certain alloys such as brass in various proportions of copper and sine can be applied to metal objects. So far the new powders are not on the mar-ket in this country but in England they are sold in

need in this country but in Engiano they are sone manil cans for a shilling each and one can is suffi-cient to plate the Effekild portions of a bitycle or to plate a quantity of house lod silverware. The powders are composed (1) of the metal to be deposited in its of mentary state (2) of a sait pre-frably a sait of ammonia and (3) of a powdered f rably a sait of ammonis and (3) of a powdered metal which must be let propositive to the metal which is to be d posited. Magnesium is the most hetro positive metal with bit is commercially prac-tical to use and in naw of the preparations this forms is a tive in all i ment in some of the prap-arations aluminium and sine are used. The follow into formula activate his size platting powder

| /lac              | I' parts by weight  |

Ordinary comm relal rine dust even though it is not perfectly pure may be used. This same formula not perfectly pure mar be used. This same formula may be used for nx rsi oft in metals. If aliver be substituted for the sine in this formula a very beavy deposit will be obstained which will have the white frosted appearance of aliver electroplating before the contribution. If aliver be substituted to the contribution of th

## MARING MILE ARTIFICIALLY

BY A JARRAN We have heard so much about the synthetic pro duction of perfumes ayrups dyes and what not from coal tar products that we are not easily surprised by the information that milk may be artificially made.

The m thod described below however is not a chemical one but consists merely in the mechani al admix ture of distilled water with crushed and finely ground Practically the only difference be sweet simonds tween cows milk and that made of almonds is cows milk contains animal casein while the artificial cows milk contains animal casedn while the artificial milk contains vegetable casedn. The latter will pro-duce a good supply of cream and if allowed to state amon time will become sour it may also be compa-lated by the addition of vinegar or acetic acid. When combined with grape usuar it is capable of generating some extraordinary organic substances. The artificial milk may be used with its and other in the same way that cows milk is used

way that cows milk is used

To make the milk produc half a pound of sweet
atmonds—the Valencia which is cheaper than the Jor
dan almond will give just as good results. The skin
of the almonds may be removed by scalding the nuis ann amond will give Just as good to results in a sain of the almonds may be removed by scalding the nuts in boiling water and perling them with a sharp knife The almonds should then be placed in a wooden thep ping bowl and thopped as finely as possible. Take bout two ounces of the chopy ed almonds and place them in a mortar with a small quantity of distilled

### THE AEROPLANE AND THE DIRIGIBLE

It is bistory of mechanical achievement it would be difficult to find a partial to the combination of totallike are and audatity with which a few man in as few years, have lifted the art on flying from the dreamland, of the impractical section of the impact of the imp

The significance of this really wonderful race become Paulina the Franchisma, and White, the Bag lishman is apparent only when we consider some of the defalls which have been cabled to this side of the Atlantic. That Paulinas should have won the \$50.000 prize in win superb style at the very first trails are tribute both to his own shill in manipulation and to reloute both to his own shill in manipulation and to race was son, but to appreciate the full significance of the race, we must remember that both enterenants and particularly White fies we for a considerable stretch of the journey at night time and what is of even more important that they did not hesitate to make both the ascent and the descent in the darkness. No orropkine is an instrument of purcision which can be relied upon to answer with certainty to the control ling hand of the operator.

There is something strongly suggestive of birth of flight in the develoption of the manner in which one of the contestants after leaving the ground swept through the air in a wide (rith is morfer to get the ins, of the land and the proper direction of flight or to lay key up again a course from which he had been driven by the wind. But certainly, the most difficult feat on a locality with which the key large and was that of making a landing at night time in locality with which the wistor was quite under quantited and where he had to make a wide develocking for a suitable stretch of unobstructed aurhave on which to allight

Last year in commenting upon the satum of the art of flying we pointed out that the one last obstacle to be overcome before flight could be reckened among the practical activity means was that of nancesatul starting and allghithm upon the average surface which would be encounted in cross-centurity flying and per forming these feats with certainty in a breeze of or disary strength. The London to-banchester mace would extainly seem to prove that this important stage in the development of human flight has been

range in development of minimal manifest in the matched and sure unfully juneed.

In strong contrast to these archivements of the scropiane is the series of disasters to atrahips, culmin ating in the wreaking of the huge dirigible "Suppella" in which have coursed during the last few weeks. Although the dirigible has proved to be perfectly stable and to possess the ability, to fight lin way against Aindes of considerable strength: the late disasters and notably the waveking of the "Suppella", suppleasation probabily the waveking of the "Suppella" in suppleasations.

# THE DECLINE OF THE UNIVERSITY IN SCIENTIFIC RESEARCH

O many valuable discoveries and researches are now due to esclarific institution under an extension of the desirable in the property of by private muniformer for specific pur poses that the question arises is it not to such agencies rather than to be universities and collected that we must look for the most active progress in future original wiertific favoretisation?

Not only are these institutions for special resourch freed from the duty and acres of teaching but what is of greater importance, their organizabut what is of greater importance, their organization and equipment are generally far more efficient. Every possible assistance is rendered to the individual investigator, and be in turn is carefully selected for his profit inerty and promise, and with ampire faculties at his disposal and supplied with an adequate treat in definite the selection of the selection of the creating definite income with entire freedom from flams creating definite income with entire freedom from flams.

At the heed of these institutions there are usually directors who are men not only of eminence in their special arience but competent to organize and court campitation of selectific research, which may latitude a number of workers often in wheley idflowed helds, yet all creaged in studies merging into one definite wheme. Each worker revelves full credit or his particular centribution, and the solution of the particular contribution, and the solution of the efficiency of organization, and cooperation characteristic of the best and most unders industrial and commercial practice. Yet there is no sacrifice of the true scientific spirit and the only elements of the commercial world that are applied are scenario of the true scientific spirit and the only elements of the commercial world that are applied are scenario of effort and resource, effectively of organization, and selectuar capital and plant to push to a satisfactory of the commercial world that are applied are seen only of effort and resource, effectively of organization, and selectuar capital and plant to push to a satisfactory of the commercial world that are applied are seen.

These conditions have attracted many investigators of reputation, and in such actentific establishments as the various laboratories of the Carnegle Institution of Washington the Rockefeller Institute for Wedjerl Research and the research laboratories of manufacturers' associations and large corporations,

bet to mention these conducts a suppless, much scientific werk is also. One might refer to the story of these conducts are the suppless, to national physical and bureaus of weights and were to mical observatories and biologue of the story of the suppless of the suppless

with the over increasing efficiency on the days, or special reasery institutions, we are breasth size to face with the fact that no longer are American capital part of the control of the

But important as are material support'and facili-ties to modern research, this is by no means the only or most serious question for the main of gastins triumphs eventually over the difficulties does their absence So extended have American universities recently become, both in scope and number of ata-dents that members of their faculties are sampelled ments that incomers of reer saturates are suggested on the merely to give an unduly large among of netrution along lines once considered understantal but in addition to offer courses in special or state branches involving no small amount of painsighing ureneration aration So, keen is the competition on the in ctual side and in the number of courses offence and in the desire for large registration that an and in the deare for large registration that an executive head of the university demands from his staff as a condition of salary advance or promotion, the greatest possible amount of teaching, be it congenial or not Under such conditions it is not difficult to see that the time and inclination for small investigation of the condition of the con special investigation and research by a young scien tist occupying a university chair may be se curtailed Furthermore, so intricate is modern uni-versity mechanism and even minor administration that from a professor there is required an ever-inthat from a professor there is required an ever-ir-stang amount of elerical labor in the compiling of statistical and other records, and information shout students and departmental activities, secord-ing to the exactions of the fluorational machinery, which to-day is and to initial commercial forms rather than commercial stiff-clear and economy of effort. Thus in the minumerate lang of the pro-fessor a function and misuse of his time, a partial explanation may be found for the hatterly poor showing that American professors of more sales. in comparison with their European collection. It condition, university presidents and traces America tell us, can be remedied by the next of great and further endowments for chairs and laboratories, but it now seems to question whether such funds are not more president. łn when applied to special institutions apart free cational machinery. It must not be underston e training of young men for scientifi has experienced any slackening of effort in our. has experienced any alackening or effort in our versities and technical schools for it is these wreat stimulated as never before by their professors, who will hear forward the torch of scientific progress. Education and original discovery seem destined in the future to be carried on by totally distinct sevanizations

That the sliver area in northerm Ontario is confined ally being widened is ordeneed by the discounding of native metal about fifty miles west of Cochange, as the Grand Trush Peatle. It is understood shift like discovery was made in blasting out a railway field discovery was made in blasting out a railway field when the news reached Cochanne, sixty propagators started out the next morning and this number is heing constantly sugmented by presh arrivals.

## AEROŘAUTICS.

Mr. A. L. Pfitzner has been making successful flights with his novel monoplane (which was illustrated in cor insue of February 18th) of late in various place On April 15th he made three successful short flights at the Buffale Country Club, and in the fourth flight he the field at a high rate of speed, rising to ran across the nest at a man race or speed, rising to a height of ten or twelve feet, when a gust of wind struck the machine and drove it to the ground with great force. The aviator was bruised and badly shaken us, and his machine was more or less seriously damto his accident, Mr Pfitmer has den ated that his novel sliding wing tips work well

sen. A. M. Herring and W S Burgess have been Missean A. M. Herring and W S Burgess have been emperimenting with the former's new biplane on Pium Islams, opposite Newburyport, Mass. This new ma oblish, which was illustrated in our issue of March 1988, has demonstrated that it can side over the spread and rise from its single side with with the use of Wheels. On April 17th, Mr Herring made a short Fillips of about 165 yards On the link to made three collabs sights, in the longest of which he covered about seeley 8 Curtis, while flying the machine at an d beight of thirty feet, lost control of it descended and struck the ground head on, tely in a soft meadow. It was badly smashed, the aviator was not injured

Wille systation advances by leaps and bounds, aero-statish has had saveral serious setbacks of late To-begia with, on April 3rd the German belloon "Pom-merts," celebrated for having won the Bonnett cup mers, celebrated for naving won the bonnet cup race is America in 1908, fell into the Baltic Sea and three of its four occupants—one, Herr Delbrück, a member of the Reichstag—were drowned The next day. Frof Abegg, a well-known German chemist, was killed while making a landing, while on the 18th ulti mo the balloon "Delitzsch" carrying four men burst during a thunder storm while at a height of several d feet, all its occupants being killed by the fish. It was at first supposed that the balloon was struck by lightning, but this was afterward found not to be the case Emperor William, however, has had a thorough investigation made and is getting to gether all the facts regarding the igniting of the gas in balloons by atmospheric electricity

As far as dirigible balloons are concerned. Germany. time past has been in the lead with this form of air craft, has also suffered severely Afte ther making various cruises in the vicinity of Co pas, the "Zeppelin II" "Gross II," and "Parseval I airships flew from that city to Homburg on April 22nd arrange new from that city to Homburg on April 22nd and were reviewed by Emperor William As a gale agrang up, the airships were moored at Homburg over aight. As strong winds continued, the "Gross II" (which is a non-rigid dirigible) was defiated and shipped back by rail. The "Parseval" and "Zeppelin II" attempted to make the return journey, but only the former was successful in accomplishing it.
"Zeppelin" lost was and was forced to descend at d at Lin "Reppelin" lost gas and was forced to descend at him burg, where it was moored again over night, and fully inflated in the morning. At neon a sudden squall of wind tore the huge dirigible from its moor-ings and it floated off without a rew A half hour later it was driven to the ground at Wellburg. It side a cliff and broke in two The sudden demolishment of this, the principal airship of the Ger-man floet, has shown how precarious is the existence of these leviathans of the ai

On April 21st Prof John J Montgomery, of Santa Clara College, Santa Clara, Cal, lectured before the Aeronautical Society in New York upon his aeroplane experiments. These were begun in 1883, and Prof Montgomery met with no little success from the start After first trying a flapping-wing mechine, he next built a monoplane glider having wings 10 by 4½ feet in size, and patterned after the wings of a guil, i e, with a downward curve in front. Upon running down hill with this first glider, he rose and glide 600 yards. steered and maintained equilibrium by leaning his body to one side or the other He next endeavored sony to one side or the other He next endeavored see secure better control, and to this end studied the birds closely. He was able to determine just how thay warp their wings. Then be built servaral machines with warpable wings recembling a first wing instructure. He made scientific experiments upon the birds power of curved surfaces; and he finally enabled. I state that the state of the stat Sixture power of curved surfaces; and no numerical surfaces; and no numerical surfaces and a faced vertical tail (in conjunction with that worked splendidly, as movable horizontal tail (in conjunction with a movable horizontal tail) that worked spiendiffy, and that could be steered simply by warping the wings. This muchine, pitted by Daniel Maleney, what cut loose from a bulloon at heights of 1,000 to \$80,000 feet, and the aviator was able to pick a sinding place and nlight wherever he pleased. Prof Montured a U. S. patent (No. 881,178) on Sepgomery secured a U. S. patent (ro. 381,172) on tamber 18th, 1906, and in view of his practical de stration of sheering suithout the use of a vertical and the reader in not as one der, it would seem that this rudder is not as one as the the Wright brothers claim.

### ELECTRICITY

The Subway Telephone Construction Company of Chicago has promised to provide that city with a complete automatic telepi s automatic telephone system by the first next year At first it will cover only the district, but later will be extended to the of June next year residential sections

Marchants in the South have awakened to the value of rural telephone lines, and are seeking to develop them, with a view to increasing their trade among the rural population. In certain sections they made large contributions to aid the farmers in building their lines

The Westher Bureen has arranged to give daily weather forecasts by telephone to farmers in Texas At noon each day rural subscribers are called up, and the weather forecast is announced to all simul taneously Subscribers in towns and cities can ob-tain the weather forecast at any time of the day after 11 A. M by cailing up central

A writer in Physikalische Zeitschrift has been investigating the frequency of electrical oscillations when a condenser is discharged through a spark gap Ha finds that this depends to a large extent on the nature of the electrodes. For instance, a discharge between copper and sliver electrodes would give a longer wave length than a spark between magnesium electrodes, and he comes to the conclunesium is the most suitable metal for sion that mag spark electrodes

A new system of jointing lead cables has been sveloped in England It consists in placing a thin ribbon of pure tin between the surfaces that are to be joined, and then heating them with a blow lamp. The surfaces in the presence of the tin melt at a lower temperature than normal, and thus they are soldered together. The tin ribbon is treated with a composition to prevent exidation during heating a composition to prevent evaluation during nearing.

Another system of joining consists in the application of a mold over the cable. A piece of tin ribbon is applied to the surfaces which ree to be joined, and then molten lead is poured into the mold. The flow is so directed as not to burn through the lead sheathing of the cabl

The fourteen-year-old president of the Junior Wireless Club of America appeared before the Scuate Committee on Commerce last week to protest against the bill introduced by Senator Depew for regulating wireless telegraphy. The young president gave a very fortible argument in favor of amateur wireless telegraph operators, pointing out the fact that if the bill were passed it would check the inventive genius of some forty thousand experimenters lie also ion to the fact that it would be impe sible to enforce the bill without a veritable army of expert wireless telegraph engineers. The junior wire tees telegraphers claim that it is possible to cut out interference if the proper apparatus is used, and that the present attack on amateur wireless telegraphers is unwarranted

The Third Avenue Railroad Company of New York tried out hast winter a gasoline-electric car or its crosstown lines. Now another type of car is being tried, and a comparison will be made of the two The new car is a re-constructed horse car provided with Gould storage batteries and a pair of five he power motors The battery is placed under the reats power motors The battery is placed under the Fests of the car and has a rating of 420 ampere-hours at 84 volts. It is made up of twenty-nine plates per cell, and there are forty-four cells at each side of the car. The masses that are generated by the battery are carried off by a ventilating system and ex tory are united by a ventuality special and call the haust under the rear platform. The car weights only six tons fully leaded. It has been found to consume in actual service only 0.54 wait hour per ton mile, while maintaining a speed of six miles per hour with nine stops per mile

The steel hull of a vessel is rendere ection by the hammering of the metal, of vessel has to have its company corand every steel vessel has to have its company cor-rected to counteract its own magnetic lines of force The magnetic influence is further complicated by the The magnetic innuence is further complicated by the load carried by the reason! If this load is magnetic or capable of being magnetized. The ore-carrying ves-sels of the Great Lakes experience great difficulty on this account, and the United States Hydrographic Bureau is endeavoring to teach pilots and captains of vessels plying in this trade how to check their course by means of the pelorus. The pelorus is an ent similar to the sun dial, being provided with a gnomon and a graduated are on which a shadow of the gnomon is east. The instrument is set in a north and south direction, as indicated by the compass, and then by noting the shadow on the graduated are, it is possible to tell by comparison with tables, furnished by the government, just how far from the north and south position the guomon really lies, thus showing the compass error

SCIENCE.
Prof. Adams, of the Mount Wilson Observatory, has been making a spectroscopic study of Halley's comet He finds the head to be surrounded by cyanogen gas and the tall be to composed of hydrocarb

Sir Ernest Shackelton received a gold medal from the Geographical Society of Philadelphia at a dinner given in his honor on April 22nd Among those who spoke in praise of Sir Erneat's achievements were such famous Arctic explorers as Rear Admiral George Melville and Amos S Bonsal

In an article published in Light Mr Robert E Liv ingston states that the first man to use gas in New York city was Mr Samuel Legget who lighted his house at No 7 Cherry Street with it The people kept at a respectful distance from the house, fearing an explosion Newport Rhode Island, and Baltimore Md. followed New York

Ray. George M. Zwack, S. J., secretary of the Philippine Weather Bureau has prepared at the requisit of the insular government a paper on "The Return of Ralley a Comet and Popular Apprehensions" for distribution throughout the islands with the object of reassuring the natives, who, it is said, are already a prey to many wild rumors on this subject

The American Philosophical Society of Philadelphia has decided to assist in the movement for an expedi-tion for south pole exploration. The project was urged in 1909, when the following wientific societies united in an appeal to Congress The American Academy of Arts and Sciences American Geographical Society California Academy of Sciences, New York Academy of Sciences, Franklin Institute, Geographical Society of Philadelphia, American Museum of Natural Sciences, Geological Society of America Association of American Geographers and the American Alpine

In a le cture delivered before the Royal Society of Naples Prof A Piutil called attention to the discovery by Palmicri in 1881 of a characteristic line o helium in the flame spectrum obtained by heating in a flame 'an amorphous, buttery substance of a yellow color which was found as a sublimate on the edge of a fumarole near the mouth of Vesuvius. This is generally accepted as the first discovery of terrestrial hellum, although Nasini and Andelini in 1906, on ex amining the flame spectrum of a large number of vol canic incresistions failed to recognize the presence of helium in any of the specimens they examined unde the condition described by Palmieri

The Express of London claims that another word ust be added to the dictionary of gardening. This 'Caloriculture' the name of an entirely new system of horticulture which has recently been inaugur ated, and bids fair not only to replace the form of intensive culture of the French whool, but to revolu tionize the present system of fruit and vegetable force ing While it is nearly customary to look for extrems and favorable developments in the line of soil culti vation, through French means, to us in the United States, who have not the garden habit quite strongly as obtains in France it comes as a surpl that the inventor of the new method is a Briton Dr F Alexander Barton, bellow of the Royal Society

For the last year systematic excavations have been made at Ostia, the ancient harbor of Rome at the mouth of the Tiber The ruins of a large city built probably by Hadrian over the old republican town, have been uncovered. Archeologists consider the dig coveries as important as those of Pompell Heretofore It has been believed that Ostia was founded by Ancus fourth King of Rome stroyed by Marius during the civil wars rebuilt dur ing the republic sank into insignificance, and was buried in the sand and deposited in the Tiber when Trajan built the new port and city of Portus Instead of this it is now certain that Ostia not only continued to flourish under Hadrian but that the old level was raised six feet and that the republican town served as the foundation for a model city with rectangular wide streets, temples fora and squares

A case of extraordinary if not unprecedented hori zoulal temperature gradient is reported on apparently rustworthy authority ir the Meteorologisch Zeit-schrift for March 1910 With a temperature ranging between 0 deg and +2 deg C at Ill-isingtors Finland on November 18th, 1909 a temperature of 20 deg to 24 on november into a temperature of a day to a deg. C was simultaneously recorded at a point only 10 kilometers distant to the north, a difference of about 5 miles. Od deg. C (68 deg. F) in a distance of about 5 miles. While the climate at Helsiagtors is tempered by the Gulf of Finland so remarkable a difference between the temperature there and in the immediate hinterland is inexplicable capecially as the two stations at which observations were made are of the same altitude of the story, however remains to be told ef rang viz., that a little to the north of the place where the low temperature was reported the weather was almost as warm as in Helsingfors'

# THE NICE AVIATION MEE

# WITH DETAILS OF THE CROSS-COUNTRY RACE FOR THE LONDON DAILY MAIL'S \$50,000 PRIZE

One of the principal aviating meetings which has been held abroad this year was that at Nies from April 15th to 25th Two of our illustrations show Parman biplanes that participated in this meeting The one in light over the sea was piloted by Duray, an old time automobile rating driver, while the one an old lime automotic rating griver, which is shown on the leach was piloted by George (haviz Chavez on the 17th ultimo accomplished several long flights above the sea In one of these the fuel gave out and the machine landed on the beach, as shown The meet opened under auspicious weather conditions and some splendid flights

were made on the opening day At one time in the afternoon four bi planes and a Blériot monoplane were all in the air at the same time Effinoff Chavez and Van den Born, alt of whom flew Farman biplanes made some excellent flights. Rougler also The results of the first day's flights in the various

contests were as follows

Total Distance Princ my sugme in the Warman

Total Distance Princ—Emmo (Farman biplane),

10 718 kilometers (817 miles) Chaves (Farman

biplane), 105 508 kilometers (45 52 miles). Van den

Born (Farman biplane), 87 508 kilometers (45 44

miles) Metret (Volsim biplane), 15 kilometers (8,31

This competition was for the total distances flown in all flights made during the day by each competitor

INVESTAR INTELL ARCH OF THE BERLING SHOW ROTE BY A. S. INDUSTRE, OURAFOR OF AUTHOROPELOUT UNIVERSITY OF

There is a type of done that can be built without a sosficiding and that requires a man to be immured within the vault to issure proper construction. It is the invention and sole property of that most ingenious of savage races, the Bakimo and contains several prin choice new to civilised architecture

There are four tandamental types of arch and dome, of which one is the Baktimp ocularity. The simplest and least used, because least effective is of the simplest and least used, because least effective is of the simplest and least used, because least effective is of the simplest and least used, because least effective is of the simplest and least used, because least used in least used. In the least used in least used i

of backing or fill in proportion to the vault area fit is feasible for a gate in a long well an underground ball or drain but cannot stand alone and is a faire orth. A free portal, or a done rising into the air cannot be best on the principle which is concentrally the best on the principle which is concentrally the best of the principle which is concentrally the best of the principle which is concentral feat true being the use of wedge shaped blocks. When the last and central one of these piece—the key stone—is dropped into place the whole mass supports itself. The top cannot fall inward unless the supports are topped outward. The primary thrust is therefore all outward the primary thrust is therefore all outward. The primary thrust is therefore all outward the primary thrust is therefore all the sort is requisite. Another therent defect of this arch though we are so accustomed to it that we do not unusly more the fact is that until the key stone is fitted into final position a temporary structure must be received to hold up the parts already in place. The last type the backet must is a true done exerts not be the last threat is a true done exerts not exceed the last into the third or stone but soow.

The construction is used for the behiveshaped winter houses of these so-called sav ages and is spiral in plan as shown by the diagrams. A row of blocks is first laid on the ground in a circle—or more exactly a polygon. Each of these has a slightly slant top and each thus

raises its surface a little beyond the last until when the circle is completed the gap in height between the last and first blocks gives the thickness for the following courses in these the upper and lower surfaces of each block are parallel as in a brick but the gradual upward trend given by the first course is of necessity maintained

In each aurecessive round the snow bricks are learned inward more by having their lower surface affected for a level If set squarely end to end they would believe loss less inswards for fast they would tun ble For this reason the end of the block hast laid to cut at an angle. The next tollowing block has also cut at an explaint the end of the block hast laid to the state of the state of the state of the state of the laid of the state of the state of the state of the fast in believe the state of the fast in believe the state of the state of the state of the fast in believe the state of the state of the state of the fast in believe the state of the state of the state of the fast in the state of the state of the state of the state of the fast in the state of the st

rrom supping inward As the house grows the circles booone smaller until at last only an irregular polygonal opening is left. This is filled with a wedge-shaped block cut to shape It is however not a key stone as the remainder of the

structure supports itself
The blokes of firm anow are unit
ally dressed cutaids and handed

### A GASOLINE MOTOR DRIVEN EARTH-BORING MACHINE BY WAITER LAN FORD

The details of construction and method of operation of a unique gasoline motor-driven earth boring machine are shown in the accompanying illustration like drive was recently designed in (alifornia by charles I believ and the photograph represents it in working position in actual operation at Sacram nice and rear believed.

It is stated that with one of these man three about 55 miles of holes were borred for use in free ing along the right of way of the Western Patifis. Rallional between Marywills and Orn-ville (al. These holes were borred under particularly trying conditions as the ground was gumbo land with the everytion of a shirt strict of marsh soil and so hard and so dry that every bit of it had to be broken with it is and crowbar when due by hand Pat of it in addition to the hard ground had about 20 to Y per cent small cobible yet this labor saving dwil e bord through all of it and did the work of term twiste to fifteen

Such a machine is of great value for bor log holes for jests for numerous other uses for which shallow holes are required and for the turnous of lightening the labors of man Exportance shows that the harder the ground and the mort difficult it is to work the more amounty a machine of this class is desired.

This intirily new unique and practical on gine driven appearance is a most remarkable device in this simplicity and cowing to its wide range of use as a labor sact. It stands un surpassed it will be seen that it is or mely simple, castly operated and cuttirely jractical

of miles ample castly operated and cutterly practical and will be found a great (commits rof time and money where post holes are to be dug electric line t I stain hor t liphone poles and or where tree and whose are to be planted in holes uniform in size at top and bettom and of suitable diameter and depth I has bed to be resetted for me.

It is hid to be ractical for use extrywher as by at the matchine will woke statical trily in either dry ct we're will or in any place wher the methic and edition as it have readily through hardpan and shale soft wandstom and small obbbe and as it will bore at different angles and on either rids or back of the truck it will do equally good work whither on kwel ground movem ger and or hilling.

ar Reedley (at a great number of holes wer bord in very hard hardpan for large poles the ma hin being particularly successful in this work because the continut between its effi-

cause the contrast between its efficiency and hand labor was as a sirongly marked. At Mendota Cal a record was made by one of these machines on large fire, work in hard dry earth 90 holes being bord 97 ft apart and 30 in these deep in 60 consecutive minut a the holes 1 ing 8 in h a in during the for use in boring anall holes a

For use in boring small holes a ritial engine of th double cylin d r type is utility d that develops 72½ hows pow r. In boring holes for large poles a machine of this type is fitted with an 18 lich augr effecting a depth of 89 feet. The power is supplied in this case by a duble cylinder gas line engine of 12 horse-power cai a ity

This divice is said to be ince passive to equal as a man and a boy only are required for its effic, in working the boy to drive the team and the man to manage the man chine Its not earning capacity is said to be greater than that of a threshing machine costing divines as much Its stanon of use the said of the said of

It is maintained that in cold countries where other farm work

PORRIDO POSTESSE OF MARTE-BURING MACHINE READY TO BORR A MOLE.

is impractical during the severe season, post holes can be dug and fonces built during the winter, as this machine is well adapted to boring through ice, frozen around, hardpan, shale and the like

In the planting of orange trees peach trees, grape vines or in having a piece of land underlaid with bard pan in which holes for any purpose are expensive to dig this form of machine will do the work of making mening through any crust for the top root of

The upper frame and horing tower being on a rotatable platform, one can custly adjust the machine to a hole on either side or at the rear of the machine When the device is in a position to hore a hole, all that it is necessary to do is to pull the feed clutch, and the auger drops to the ground and begins work, when the auger is leaded, by releasing the feet clutch and pulling the hoist clutch in, the auger is holsted clear of the ground, or to any other position that may be

It is of interest to note that besides boring in the kinds of soil before mentioned the machine will in dry clay, or in awamp land without any change of augers or bits no ground being too sticky for it to There is no necessity of stonning the machine to ckan mud off the auger as the machine does that freelf

If there is an occasion to hore a line of holes down the middle of a well traveled road it will do the work without difficulty. A small type of earth boring ma 4 feet and which is equipped with two augers 8 and 12 inches in diameter, while a larger machine has been developed which will hole to a depth of 6 feet latter is fitted with three augers 8, 12, and 16 inches in diameter

inches in diameter.
It is stated that no change of shaft or augur is required to make the depth inditated. The time required to move from one hole to another and begin work in a fence line is from 15 to 25 seconds.

The fred pinion of the machine as well as the feed rack, drill shaft gearing, and auger shaft are made of crucible and machinery steel so as to withstand a sudden impact as when stopped by running against rocks, old posts and similar obstacles

Chain belting is used of the standard sprocket type Chair belting is used of the standard approved type and in case of a break can be casily replaced. It will be seen that this machine in boring does not seeape the earth but cuts it with chisel bits, which are quickly detachable the entire set being changed in two minutes if desired

It is reported that this machine has bored many holes 30 inches deep in hard ground in fifteen seconds for each hole from the time the auger touche the ground, and it is hard ground indeed when the cannot be bored in a minute. It has force and therefore all the attendant has to do is to pull the lever and the machine does the work

# LAURCH OF THE "FLORIDA."

On the morning of Thursday, May 12th, there will be launched at the Brooklyn Navy Yard the second of the two largest battleships yet built in the United States the 'Florida" The sister ship, the "Utah," States the 'Florida" The sister ship, the "Utah," which in December last took the water at Cainden N I from the building slips of the New York uilding Company, weighed about eight thousand The launching weight of the 'Florida' will be lone about nine thousand tons, which is, in itself a record for an event of this character. The keel of the "Florida' was laid on March 9th of last year, and the work ida was laid on March 9th of last year, and the work of construction has been carried on uninterruptedly under the supervision of Naval Constructor William J Haxter with Naval Constructor William G Grossbeck immediately in charge in view of the great imp

nportance of the ship, and the gratifying rapidity with which she has been built. preparations have been made to render the coremon; of launching particularly brilliant. Among the guest of launching particularly brilliant. Among the guests on the launching palatorns will be President Tati, Severary George Von J. Meyer, Assistant Secretary of Florida with his staff, Admirat D. weep, and Reserved Admirats Evans. Septry S. througher, W. alluvright, Potter and Luntze. As the battleship fieed is now present at the yard between six and soven thousand blus-lackets and the officers of the ships will assist in giving dignity to the event. In agreement with the custom of laving our ships christened by a representative of the State or city after which they are named the of the State or city after which they are named, the ceremony will be performed by Miss Elizabeth Flem-ing of Jacksonville Fla

The naval constructors and employes of the Brook lyn Navy Yard are to be congratulate ed on having, for in easy tars are to be congrantated on awing, for the second time demonstrated that they are capable of building the largest and most modern warships, not only with dispatch but of the most thorough and durable workmanship, for it will be called to mind durable workmanship. for it will be cause to mind that from these very ways there was launched on September 29th 1904 the flagship "Connecticut," which, although a much amelier ship than the "Florida" (leasn by about 6,000 tons, in fact) was nevertheless the

largest vessel of her time in the United States navy. and approximately as large as any vessel in the navies of the world. It is a long step, however, from navies of the worst. It is a long step, however, from a fs,000-lou "Gonnettent" to a 18 f3-fb-on "Fairdia," and the Brooklyn Navy Yard should receive full credit for the fact, that while eighteen and a harmonth elapsed from the laying of the keel to the launching of the "Gonnecticut," it has taken only jaunching of the "Connecteut." It has taken only fourteen months to do the ame amount of work on the big ship. The material has been built into the hull at an average rate of about twenty-few tons per working day of eight hours. If all goes well, the hull and accessories will be completed early next spring. The date of the completion of the machinery is some what uncertain, the recent reorganization of the navy yard having thrown the steam engineering shops

somewhat out of their stride

The greater length of the "Florida," which exceeds
the "Connecticut" by over sixty five feet, her greates the "Connecticut" by over sixty few feet, her greater beam of eleven feet four and a half inches, and her in reased launching weight of many thousand tons necessitated, or ourse, a great enlargement and strongthening of the permanent and launching ways, and severely tract the capacity of the building slip Our front page illustration shows how the ram of the ship outside articity arross on on the attract of the ship catende articity arross on of the street of the the wall of a building In spite of this fact, the stern of the vessel reaches

most to the buikhead wall on the water front Just here it is well to notice how, in order to see the desired speed of 20 75 knots, the lines of the ship have been fined out, as compared with former battleships The entrance of the "Florida" appears to be as fine as that of our armored cruisers. At the same time in order to secure good lifting power forward, when the ship is driving into head seas, above th water line the sections are flared out very rapidly, thus giving the ship a form which is not only buoyant and seaworthy, but adds greatly to the appearance of

The "ways" consist of the permanent ways made up of the supporting piling, cross caps and longitudinal timbers and the launching ways, in which she im mediately rests, built to conform to the underwater the ship, which travel with her as she moves down into the water The heavy longitudinal timbers, which form the sliding surfaces between the fixed and launching ways, are thoroughly lubricated with a special preparation, consisting chiefly of tailow, lard oil and graphite The contact surfaces are made lard oil and graphite The contact surfaces are made sufficiently broad to bring down the maximum pres-sure on the ways to 23 tons on each square foot. The ship is released and started on her swift slide into the water by sawing through the "solo beams," which are the last members that connect the launching ways with the permanent ways. The "Florida" will move very slowly at first but gather way rapidly, and her

very slowly at first out gather way rapidly, and her highest velocity will be about twenty miles an hour With the launching of the "Florida," the United States navy will have affect its first complete division of ahips of the dreadought type consisting of the "Delaware," "North Dakota," "Utah," and "Florida." A study of the accompanying table shows that the COMPARISON OF THE ' NORTH DAROTA 1978, AND THE "PLOBIDA," 1990.

" North Dakota " 51N feet 9 inches, N5 feet 354 inches, S5 feet 11 inches S1JED tone, S1JED tone, S1JED tone, S1JED tone, S1 inches, S inches, Ten Pourteen Gif feet 6 inches, Hi feet 9% inches 18 feet 9 inches, 18 feet 5 inches, 18 feet 5 inches, 20 feet, 19 inches to 6 inches, 6% inches, 9% inches, 17 inches, Beam Displacement Coal supply Oil
Belt armor
Purse tarmor
Battery armor
Smokestack prose
Pwelve Inch guns
Five Inch guns,
Spect contract

"Florida" is an enlarged "North Dakota, having the ween perpendiculars, and two or three feet greater length over all, three inches more beam; one foot seven inches more draft, and 1,835 tons greate displacement. She is designed to have three thousan aspisermont one is designed to have three tanusammore horse-power, but a quarter of a knot less speed. The armament in each case consists of ten 48-sailte 13-inch guns mounted in five turrets on the central line of the ship. The 12-inch pieces for the later ship. in the case of the "Wyoming" class will be more powerful, being fifty calibers in length with a correspond fritt, deing hit; cansers in length with a correspond-ingly greater mustle velocity and energy in the broadside, torpedo-repelling battery, the "Florida" has two more 5-inch guns than the "North Dakota."

It is claimed by our Navy Department that the Florida" and her sister are the best-protected warships afoat special attention having been given in her design to guarding the vital parts of the ship against design to guarding the vital parts or use many mortal injury and to the localising of the destructive effects of projectiles and torpedoss. Against sinking by torpedo attack the "Florida" is nateguarded by an other bases of the hull and an unusually powerful pumping plant for ridding the ship of such water as may enter Against gun fire she presents

robably a more complete system of artifer protection han any contemporaneous warship. The main armor elf, over eight feet wide, has an average thickness of lawn tenders. probably a more complete sys belt, over eight fred wide, has an average innomes or eleven inches, above this is another eight-foot belt averaging nine inches thick, while the five-inch broad-side battery on the main det is and the bases of the smokestack carry heavier armor than has been placed on any previous United States ship, the front start of armor being \$4\times inches has been placed of armor being \$4\times inches inches inches inches and a wall of \$4\times armor To reach the bases of the smokestacks a shell would have to pass through \$4\times armore the same through \$4\times armore through \$4\times armore

smokesticks a shell would have to pass through Nig-thebes—an unprecedented but, as the Japanese war showed, a necessary protection Between each pair of chick puss is a Sinch transverse, splinter bulkbad. The "Florida" will be driven by an equipment of Parsons turbless, swirking on four safets. They are required by contract to develop 28,000 horse-power, which, it is estimated, will enable the ship to maintain an average speed of 20 76 knots on trial. As a matter of fact, she is likely to do from three-quarters to a knot better than this. The "Florida" will store, to addition to 2 500 tons of coal, some 400 tons of oil fugi. addition to 2 500 tons of coal, some quy tons or on tage. Our naval constructors have long recognized the wallow of oil as an auxiliary fuel, and as far back as 1849, when the plans of the "North Dakota" and "Delagare" were drawn, provision was made ton storage of all, the ships of that class carrying 400 tons.

built by contract with a private yard, was laid on March 15th, and the keel of the "Florida" on March 7th The "Utah" was launched on December 23rd, 1909, at the 50 per cent stage at pletion, and the "Florida" on May 13th will take th water with 68 per cent of the work completed, a comparison which establishes once more the much tested claim of the Brooklyn Navy Yard that it can build as rapidly as the private yards

# The Aubricating Value of Mineral Lubricants at Wish

The behavior of a mineral lubricant at very high The behavior of a mineral lubricant at very happy interpretative is dependent upon its chemical and physical properties upon the nature of the atmosphere with which it is in contact—dry af carbon dioxide, or water raport—and upon the pressure of this atmosphere. Schreiber in a recent article describes his investigations of the lubricating value of mineral lubricants of very high melting points, in various conditions The diminution of the lubricating power at high temperatures is due to the evaporation of a portion of the lubricant and to the formation, oxidation, of compounds of the nature of asphalt, i a, compounds insoluble in benzine it is not due to polymerization, as is generally believed This increase in asphaltic matters is not produced in the presence of water vapor alone, even at a pressure as high as 71% atmospheres. In this case the diminution of the lubricating power is due solely to the evaporation of part of the lubricant. On the other hand, when the icant is in contact with a gas which can exert an oxidizing action, compressed air, for example, the for-mation of these insoluble compounds is the chief cause of deterioration Schroiber deduces from these experiments laboratory methods of measuring the lub ing power at high temperatures, according to the class of machine in which the lubricant is to be used

## The (urrent Supples

## WHY WATCH SPRINGS BREAK.

# To the Editor of the Scientific August

It was with an amateur's interest that I read the isonssion in your pages as to "Why watch springs break." As th on apparently still rem settled, I feel tempted to contribute some addition views on the subje

rly clock springs were finish giving the convolutions considerable friction upon each other For this reason, when running down, there was a very audible shuffing sound within the there was a very saudible shuming sound within the clock every few minutes, indicating the propelling force was spasmodic. Not only so, but the ticking sound of the escapement decreased in loudness as the time was prolonged from the last loosening of the To regulate this it occurred to me to apply a more unctuous lubricant to the spring to prevent the said friction. The result of so doing was a gratifying uniformity of tick—but only for a few hours—until

unnormity of team-out only for a few nours—until the spring broke After the third experience of this kind I caused to regard it as a more coincidence, and thereafter applied no oil if there was sufficient to prevent ruiting already on the steel.

The uncoiling of a watch spring and of the kind of clock spring that has just been described differs in that the watch spring unwinds from the outside of the coil, while the clock spring arbor backs up and un-winds from the center of the coil For this reason the latter is not subjected to a breaking from contraction due to cold, as there is always some room for the contraction to take place—excepting a possible mo-seentary period just after winding. The same is not the case with a watch spring.

over-lubrication is destructive to the structure of stoel in a clock spring, by rendering all the convolu-tions continually active and under unremitting strain, the same would also apply to a watch spring Watch the same would also apply to a water appring water apprings being smaller than those intended for clocks are naturally proportionally stronger and may endure the strain longer, but that it is detrimental is proba-ble. But oil on a watch spring is absolutely necessary solely to provide for this thermostatic movement which can only take place back and forth, to and from a fixed point—the arbor Yet the wearying strain on a spring due to over-lubrication can only be a contribu tory cause to the prevalent breaking of this part. Ex nce goes to show that the most frequent breakage is from an hour to three hours after wind-ing, and that the most frequent position of fracture is just outside of the annealed tip attached to the

Thus the owner takes his watch from his pocket where its temperature was, say 80 deg, and winds it until it brings up hard. The coll is then central and solid upon its arbor, which is held fast by a pawl

In a little while the wearer of the yest containing in a little while the wearer of the vest containing the watch romoves it, hanging it on the back of a chair while he retires for the night The temperature of the watch gradually falls to say 60 deg. Has con-traction been provided for? The morning will dis-close. If the coil has not been wound too tightly on, if some time has elapsed before cooling to enable it draw on what has been paid out, or even if the rate of cooling and consequent contraction has not exceeded the rate of release due to the movement of the works, the apring may escape But what surprised writer is not the breakages but the length of serv

ice many aprings attain

When one considers that the greatest movement of contraction is on the outside of the coil, because of its contraction is on the outside of the coil, because of its greater area, that the coil has just been readered taut and rigid by winding, and that then a powerful con-tracting force is added thereto, principally on the out-side of the circle where the leverage is greatest, it is not difficult to realize what an unundurable sitzal takes place close to the fulcrum, the arbor, for the spring is then but a solid lever

The fracture of a spring in many places is also not hard to understand, if we imagine a spring stretched to its elastic limit by contraction from cold with no alack to draw upon, each turn of the spring, from the outside inward, at an ever-increasing tendon. An inner turn anaps, instantly contracts, and by that proinner turn snaps, instantly contracts, and by that pre-cess increases the spreading or expanding tread of its temper. The change is altogether too rapid to permit of any uncolling movement, and the force thus added to the adaptest surrounding strand fractures that, agitating force with such succeeding fracture until, like a "Prizee Raport's drop," the pentup strain comes to rest with a replact's drop," the pentup strain comes to rest with a replact's sufference.

That the pieces display magnetism does no scenarily indicate that it was produced from external

nce, but rather that it was evolved by excessive strain and retained by the steel by virtue of its hard nees, as is similarly evidenced by many machinists

tools subjected to severe service.

Regarding the preference of springs to break in the

mer months, is it not sufficiently evident from the wing three causes?

The more constant and wearying strain due to

the better lubricating effect of warm oil.

2. The increased solidity of the coll when wound

up, due to a thinner film of oil between the convolu ions, also due to warmth

3 The looser texture and greater proportional

3 The looser texture and greater proportional hrinkage of a warm spring compared with a cool one. As to the remody for this uncertainty of time-keep-rs, it would seem sufficient to provide for the longitudinal expansion and contraction of the springs, and the simplest way would be to make them of metal in-sensitive to these changes. Such an alloy has been I IN SCIENTIFIC AMERICAN SUPPLEMENT, described in Schwitzic Americas Supramers, in 174, by M (ulliame, which be calls 'Invar' and in composed of steel with an admixture of 36 per cent and in composed of steel with an admixture of 36 per cent graduated schole for instruments. The fact that it does not rust should complete its adequability to this purpose, as then it could be used without imbricant and thus, except for a short portion at one time, be relieved of continuous and crive strain.

Just how the nickel component will affect its per manency of temper remains to be proven, but even if it retains sufficient recoiling force for its purpose fo five years only, it would at least give warning of its

nee years only, it would at meat give warning or its waning strength and not leave its owner in the lurch, which is perhaps all the improvement needed Another possible remedy which modern practice would indicate as quite feasible would be to carbonize would indicate as quite reasing would be to carbonuse the reds or plates, from which the springs are drawn, from one side only. The result would be, when chilled, a hard side (for the inner side) and a soft or elastically tough side (for the outer side) with a general benefit of greater spring power with improved tensile

Watchmakers will tell you that the breaking of main springs saves meny good watches from having their plyots out off, from shear wear, and the yiews of the manufacturer need not be consulted but the ordinary citizen would prefer to have the spring as reliable as the rest of the watch

JAMES E FRANKE St. John N B

## INTERESTING MAGIC SQUARE.

To the Editor of the Scipatific Ambrican In the December 31th issue of the Scipatific Ambre-can (page 436) Mr. A. Galpin gives an interesting construction of magic squares, containing all the odd

| 42 | 84 | 36 | IR, | r) | 74  | 66  | 38 | 50  |

|    | *  | 10 | 8   | 81 | 64  | 86  | 88 | 40  |

numbers in the inscribed diagonal square. But this construction is applicable not only, as Mr Galpin says, when the basis is a prime number, but more generally when the basis is an odd number (1, 3, 5, 7, 9, 11, ) The proof is very easy there is here the square of 9, as example of the simplest odd number ot prime the general proof is an interesting exercis of algebra. os. Italy

### STOROGEN IN A HOT-WATER STREET.

To the Editor of the SCHENTIFIC AMERICAN
A short time ago I noticed a phenomenon which I believe will be of interest to many of the readers of

Deliver will be or interest to many of the research of the Stiffright America.

The main building of our experiment station here is heated with hot water it has been one of my duties to see that the system is working properly, and in this connection I have had to open the air vents on the radiators frequently. I was surprised to find that the radiators on the top floor (a two-story building) al-ways seemed to have air in them, in spite of the fact that the system was fully charged and very little or no new water admitted. I began to suspect that this condition had to be accounted for in some other way condition had to be accounted for in some other way was there not a possibility that this gas could be hydrogen. For what other gas would be likely to form under those conditions, unless it be a trace of carbon monoxide? At any rate, when I applied a matrix that the familiar pop of brdropen and buryand with its characteristic almost colories fame and buryand with its characteristic almost colories fame of testing 11), the question suggests itself: Is this a se of exidation of the iron setting free hydrogen? Is it an electrolytic effect, caused by galvanic couples of

either carbon and iron or iron and the brass con stage cargon and iron or iron and the grass consis-tions in the system. Or is the gas methane? It may be noted further that the gas does not seem to collect in the radiators in the lower floor to a great extent. If any Of course, this may be due to the gas a dissolved under the increased static pressu static pressure on the radiators of the top fic or is no over ten feet of water at the present time. The water is of exceptional purity, being supplied by a spring The fact, however that small quantities of water have to be added occasionally to replace the leaks in the That only be settled by chemical analysis C WESTERGAARD Puyallup, Wash

## AN EARLY APPEARANCE OF ENGINE COMME

To the Editor of the Sciparitic American

The change which has come to the people in reference to comets is worthy of notice. Beventy years the change whith has (once to the people in reter-ince to connect is worthy of notice. Seventy years ago when Encle's comer made its appearance a great deal of fear was aroused. I was a young boy, but remember very well the alarm of the prople. It was indeed very strange and portentous, for it switched about from the senith to the hortzon, and was very Its color varied from a light to a flery re and its length was such that it stretched from the and its length was such that it stretched from the soulht to the horizon I hovered so long and was so conspicuous that all classes, young and old, were greatly impressed About that time the Millerite ex citement prevailed, and there were many who looked upon the comet as a sure sign that the world was surely coming to an end. There have been other comets which impressed the people but this exceeded ers in the impression made

## A New Sense Organ of Butterfles.

Every butterfly collector has had the unpleasant ex-pertence that some butterflies, and particularly those of the species of Catocala (mourning cloak) will no-lice his approach from a distance and fly away in time. This observation led Tetens to think that these animals must have an auditory organ which warns them of approaching danger by receiving sounds, and accordingly he expressed the supposition that two pit-like depressions at the first posterior segment of the ody might be organs of hearing A thorough investigation of this organ, however, has been made but recently by Prof Dr Decgener, the results being pub-lished in Zoologische Jahrbücher, Abteilung für Austomic, vol 27, No 4 1909

is rather surprising that with a group so frequently collected (although indeed investigated, as a rule only as to their position within a system) as the Nortuide, an organ could escane observation which is found quite generally in this group and which is by no means introscopic, but can be observed without difficulty with the naked eye as a striking formation on each side of the first abdominal segment. This location probably explains why this organ should have been seen by many persons without arousing the suspicion that it could be a sense organ, for naturally enough such organs are looked for chiefly at the head, particularly at the feelers, although other parts of se body may be the seat of specific scase organs, for instance, grasshoppers have their organs of hear-ing at the base of the abdomen, that is at the same place where the corresponding organ of the Nortuida en discovered

When examining the animal we see on each side at the line separating the chest from the abdomen and near the points where the rear wings are attached, a deep channel which toward the surface is fached, a deep channel which toward the surface is surrounded by several humps. The external morph clogy of this organ varies in details with the different species of Noctuide, with some the opening is scarce by visible from the outside being concealed by long ly visible from the outside being concessed by tong hairs act close together. The microscopic examina-tion of a series of sections shows that only one of the ridges in the vicinity of the cavity of the organ, the one nearest the back, can be considered a "sensitory ridge," but that this one has true sensitory cells and sensitory hairs and thus gives the organ the character of a sense organ. Telens's supposition, mentioned above, that this is an auditory organ may very well be maintained since the structure of the organ an awers all the requirements of an organ of hearing Still experimental confirmation of this hypothesis will have to be awaited Dr Deegener promises a further report, dealing with this phase of the subject.—Pro-

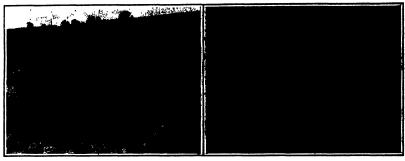

Approximately 3.748 miles of new main track were built in the United States during the year 1909 as compared with 3,214 miles for 1908. The 1908 record was the smallest since 1897, when 2,109 miles were built. These figures do not include new second third butlt or fourth track sidings or electric lines. The net in crease during the year is about 1615 per cent, and 28 per cent less mileage was built than in 1907

# REINFORCED CONCRETE WATER WORKS CONSTRUCTION

BY FRANK C. PERKINS

The accompanying views of the Indianapolis water works show an Interesting application of relations concrete to this class of construction. A gravity flow supplies the rainforced concrete filter plant from the Indiana State. Curtal Cuall which was constructed originally by the State for transportation purposes, but was taken over for water works service A 1 a disA reinforced concrete pipe line which is 860 feet in length, and has a diameter of 86 inches, and a shift of inches inche, conducts the raw water to the precipitation basin. The pipe is laid 11 feet below the hydratility gradient. It is reinforced with ½-inche wisted bars spaced 8 inches on centers, the shell of the pipe being built in three operations.

are 8 inches in width and 19 inches deep. They are carried on 18-inch 1-beams, incased in occerete and bolled to the odjuman. The reinforced partition walls, 1 foot thick, are 350 feet in length. They are reinforced in both directions, and measure 14 to 11 feet in height. The entire slab covers 70,000 square feet in each double filter It is built moscilithe, without

View showing construction of the ground-arch floor, with the reinforcement and forms in place

Operating floor of the chemical house in which the water is purified in lime and iron saturating tanks.

tance of about 6 miles above the intake to the filters are to sted the head gates and concrete sittles ways of this canal which is carried over Falls Creek near the filter plant in an open aqueduct at an elevation of about 18 feet above the creek.

The chemical house columns, floors and walls as well

The chemical house columns, floors and walls as well as a start way and roof are of reinforced concrete throughout. The lower part of the building contains the line saturating tanks over which are constructed the tron solution tanks all of which are of concrete They are used in connection with the congulating basins in the treatment of the raw water during seasons of excessive turbidity.

The following account of these works is based upon data formhold by the constructing engineer, William Curlis Mables. The start, which is drawn from the Raw Riter is interfied by coagulation in precluitation basins, which are provided with battle walls spaced for the tapart, and which are reinforced for the prevention of cracks. A 4 linch state of concrete, reinforced with stailed roots squared 4 feet spart in each direction is used for lining the simples unbankments of earth in the six highly state of the spart of the spart of the state of the spart of the spart of the spart of the links in this change, that in his case 8 feet square, in

The water is measured in a Venturi meter, 42 inches in diameter which has a throat diameter of 21 inches The meter is built in the raw water conduit the indicating apparatus being located in the laboratory In the construction of the conduit a concrete cradle of inches whe was first laid to grade in this were imbedded the lower rode, which were heated and bent in the field to the required shape, and left long concept to project a foot into the upper ring. On the cradle were then placed the semi-trends metal forms, which were fastened down by staked timbers. The nititure and I of recurst, was poured into the space forming the lower half of the pipe. The upper half was then constructed by inverting the metal forms. The cost of the pipe, which contained about 500 cmble yards of concrete, was 124 day per cubble yards of concrete, was 124 day per cubble yards.

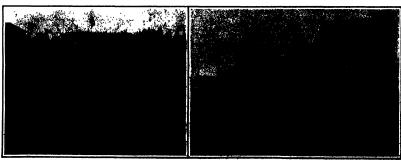

The pure water reservoir, with a capacity of the million gailons, was built near Palla Creek, on a gravel foundation, at ordinary ground water level. The earth fulling is 2 feet deep on the cover, the weight of the structure listed overbalancing any upward preserve that may occur. The groined arch bottom was desired to reals the upward throat of high ground interest of the properties of the bottom consists of \$\frac{1}{2}\$ (not twisted bars, spaced to lacks on centure in such direction.)

The filter cover consists of reinforced 3 inch slabs, supported by concrete beams, a trifle less than 20 feet long, and spaced nearly 7 feet on centers. The beams any atampt to provide expansion joints. A cable trave wy with a page of 469 feet was used in the commention. A stationary engine and cable was used for propelling a shuttle car on a narrow-gage track, over which the concrete was handled from the mizer to the archeway, 10 cultic yards per 440 pating used in coversulting the control of the control of the walls \$12.00 feet.

The reinforced concrete aqueduct, 300 feet in length, contains 4,600 evile yaris of concrete, which cost \$4.55 per cuble yard including the cement, steel, sand and gravel, as well as the lumber, forms, labor, and concrete labor It is 41 feet wide and has four spans of 50 feet each with a 10-foot rise from the springing line to the softi, and a crown thekness of 18 inches for each of the four segmential arches.

to the softi, and a crown thickness of 18 inches for cach of the fore segmental article. The foundations for the piers, wing walls and abuments were carried down 18 feet below low water, and rest upon a bed of and and graviel. The squedect takes the piace of a wood aquowiet, which was supported by steel trussee on massory piers, all of which were carried swar by a flood which undermined the middle pier, the superstructure breaking up as the subtracture crumbled away.

With regard to the use of concrete for works of this character, Mr Mabee, the constructing engineer of these water works, makes the following comments:

Meet reinforcement of the Silinch conduit.

The content execute plant for paining the concests.

## Scientific American

Observée has many advantages over other types of southwisten. It is eastly and conveniently hands and transported, other at a less cost than stones ma-searly, and often suitable sand and gravel for the work in hand can be found on the site. With proper supervision, skilled labor is not essential in the usual work, moreover, the art of mixing and hand-ling concrete has been so perfected that machines do most of the work. Concrete has the additional advantage over stone that it may be molded into intri-

To produce concrete t

To produce concrete surfaces of a satisfactory smoothness and uniformity, it is necessary that the molds be carefully and properly built, and also that the conports be of the proper consistency to flow adily into the prepared It is also neces molds. It is also necessary to theroughly churn and keep it in motion in the molds until the sir has been removed and every erevice filled with mortar Properly handled in this mortane it will not be necessary. manner, it will not be nec essary to brush or plaster the work after the removal of the forms. Con-crete may be placed in moderately freezing weather, provided proper precau-tions are taken to warm tions are taken to warm the gravel or stone and mad, to heat the water and to cover the work until initial set takes place.

The problem of prevent-ing ugly cracks forming in concrete is one that has concrete is one that has worried many engineers.

Plain concrete is liable to crack where you least ex-

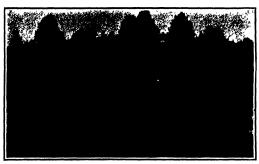

eracks where you least ex-pect it, and it has become the practice to provide for those cracks by building short sections in alternate blocks. However, by the judicious introduction of steel bars, objectionable contraction cracks can be entirely eliminated.

entirely eliminated.

The water works ongineer or superintendent is par-ticularly interceted in the subject of waterproofing concrete it has been shown that wet concrete is more dense and consequently more impervious than more dense and consequently more impervious than dry concrets and that concrets becomes more or less persus as the quantity of cement is increased or di minished A smoothly troweled surface produces a water-tight film or skin it has also been found that siaked lime added to the concrete mixture helps to make it less permeable. The lime does not injure the cement in any way, although retarding the setting Coal tar, pitch and asphalt mixtures applied on concrete are used with more or less success. A wash composed of one pound of Ive, five pounds of alum and two galions of water, applied with a brush and well rubbed in, has been used successfully on govern ment fortiScati

ment fortifications.

A rich cemeit mortar plastered over concrete makes
a very good waterproduig medium Proper attention
to these details will produce a water-tight structure,
if there is not likely to be contraction cracks, but in
works of any magnitude these are bound to occur
and they can be best provided against by the litzduction of steal bars. A rich concrete property rein

Covered reservoir under construction, a wing the ground floor, the reinferced slab reef, and the

forced, conted with plaster and troweled smooth makes an ideal waterprooff structure

The Baylight Efficiency of Artificial Illum In a recent publication of the Bureau of Standards. in a recent publication of the Bureau of Standards, Mr H E. Ives suggests that there is need of some method of estimating the resemblance of artificial illuminants to daylight, that is, of determining their daylight efficiency Assuming that, by the extraction of certain qualities of light in an illuminant its color or certain qualities of ugar in an imminant incomplete or could be brought to resemble that of daylight very closely, the daylight efficiency of a source might be expressed in the form (intensity of surface) for two suggests two methods of studying this question. The first is based upon the use of suitable absorbing screens which, as explained above, could be used to bring the color of an illuminant into near agreement with day-light, though reducing its intensity in doing so. Mr Ives presents some spectrophotometric curves of various sources of light, and a diagram illustrating the amount and nature of light from the various sor amount and nature of light from the various sources which must be absorbed to produce white light. He also tabulates the "daylight efficiency of a number of artificial illuminants. The method, however, is of of artificial illuminants. The method, however, is of practical rather than of scientific interest since it depends upon the particular wave-length for which the intensity is assumed to be unity, when plotting the spectrum curves. In addition, "selective" sources such as the mercury are lamp

which yields a spectrum consisting of isolated bright lines, would work out to zero efficiency at cording to the above by sensation such sources contain a certain amount of white light Mr Ives then proceeds to discuss the fact that any color can of white light and one ray of the spectrum. The used in attaining such a match to the in usity of the source studied is then regarded as an alternative method of defining white light efficiency which Mr Ives in this case terms "white sensation effici ency" He points out that classification on this meth od gives rise to materially different results from those arrived at by the

ficiency in the case of the second method appears to be higher Yet the result gives no indication of the ability of the source to reveal colors of surrounding objects, and merely indicates the color of a white sur face illuminated by the source in conclusion, Mr Ives remarks that the first method is preferable from the practical standpoint, and the latter from the purely scientific one

It is estimated that the Gold Coast and Ashanti could supply 60 843 logs of mahogany ar year if the internal communication were better With mechanical haulage, such as traction engines and light tramways, the output could be increased to some 0 logs per annum without depleting the natural

Agricules by which the water is conducted to the fitter plant of the Indi

bilities of reinbrood concrete are shown in this graceful, arched aquada DED CONCERTS WAYER WORKS CONSTRUCTION.

# THE HEAVENS IN MAY

BY HENRY NORRIS RUSSELL

is seldom that so much of interest to single month as in the one which is

just before us Pirst and foremost, of course, is the return of lialley's comet to the posi-tion where it is seen to the best advan-tage. Early in the month it is favor ably placed for observation before day break, on the 18th it passes directly

between us and the sun, and later it appears to eve greater advantage in the evening sky

At the beginning of May the comet is about 74 million miles away, but it approaches us rapidly, its dis-tance diminishing to 41 million miles on the 10th, and 27 million on the 14th As it was about at the limit of visibility to the naked eye on April 12th, while still 135 million miles from us, it is now a fairly conspicu

The planet Venus is fortunately near by and serves

an excellent "pointer" to the comet. Anyone, however little familiar with the heavens, can easily find the latter by observing the following di

rections. e a window from which the eastern sky is visible clear down to the horizon Rise about 3:15 A M and look due east. The very bright starlike object, low down in the sky, is Venus. The comet is to the left of this and a little higher up at a distance about as great as the length of the bowl of the Great Dipper It will probably be rather fainter than the four stars, forming a great square, which above and to the left of Venus, about twice as far away as the comet.
These directions hold

good from May 1st to May 12th On the 14th the 12th On the 14th two comet will be on a level with Venus, and a little farther to the left On the 16th it will be much lower than the planet and about 20 deg to the left. After this the comet, or at least its head, can hardly be seen clear of the morn-

ing twilight
It will be very interest ing to watch the comet grow larger and brighter night by night as it comes nearer to us How long its tail will be it is impossible to predict. The best time to see this however. will in any case be from the 7th onward, when the

moon is out of the way moon is out of the way
and the sky dark. The cumet will be larger and
brighter, too, at this time than previously.

Even after the head gets too near the sun to be

seen, the tail may be observable in the mornings of seen, the tall may be observable in the mornings of the 17th and 18th extending upward and to the right from the castern horizon, perhaps broad and fan-shaped, from the effects of perapective since the end of it will be much nearer us than the head

or it will be much nearer us than the head On the evening of the 18th or morning of the 19th (according to the observer's longitude) the comet passes between us and the sun, and the earth will be enveloped in its tail if the latter is long enough (over 15 million miles)

this evening is clear it will be of great interest If this evening is clear it will be of great interest and importance to look for illumination of the sky in the early evening, just after sunset, the cometic attain will be in the east, but a few hours later it will have passed over toward the west. If, as is seen-itness supposed the tail is a hollow come of light, there will be two times at which the sky in general is comparatively brightly illuminated separated by an interval while we are in the darfare center of the all Measurbile, observers on the opposite side of our planet will have the rare privilege of seeing the sun through the comet's head. Only the extreme western portion of the United States is included in

this favored region, but as the comet enters upon the sun's disk at 6 22 P M by Pacific standard time and remains on it till 7.22, the transit will be visible all along the coast. The comet passes almost squarely across the center of the sun from west to east.

Paradoxical as it may seem, it is probable that the ordinary observer, even with a small telescope and orquinary observor, even win a small celescupe asset dark glauses, will not be able to detect even the slightest trace of the comet's passage With powerful instruments the nucleus, if solid, might be seen as a dark speck against the sun, if it is over 50 mlies in diameter, but it is improbable that it is anything like so large, for, as has already been stated in these columns, the whole amount of light reflected from the county of the property when you are the columns and the columns are the columns and the columns are the columns and the columns are the colum

columns, the whole amount or ingar resected from the a single mass 30 miles across would send us. It is possible, too, that the absorption of the gases composing the cavelopes of the head and the tall may be detected by means of the spectrocope, and as we will be looking through the tail lengthwise,

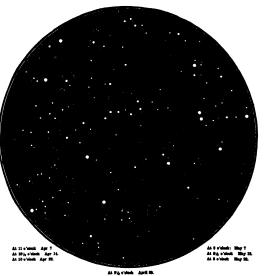

the sun on the Sth and of the moon on the SSTd. The former is an important solipse, the maximum duration of the total phase being over four minutes, but unfortunately the track of the shadow lies almost out uncortanates the track of the anadow use almost entirely in the Southern Comm. only crossing the southern half of Tammania, so that few stations are available for observers. As a partial cellpse it is visi-ble throughout Australia, New Guines, and the neighboring islands

boring islands.
The lunar eclipse of the 13rd is of more interest to us, being visible throughout the United States, excepting Alaska. The moon enters the earth's panumbra at 9-32 eastern standard time, and first touches the shadow at 10 48. At nine minutes after midnight the shadow at 10 44. At nine minutes after middings and despress of the disappears in it completely, and does not entered till 1 A. M. At the middle of the colleps, however, the coulters deg is only about 300 mine inside the shadow, so that it will be considerably illuminated by sunlight refracted through our staneophers. At 2 35 A.M. the moon takes leave of the shadow antirety, and at 2 84 of the pecunical collection of the control of t

This eclipse will be of importance to observers on the Pacific coast, as it will give them a chance to photograph Halley's comet on a dark sky The comet will have set for unin the east before totality

THE HEAVENS With so much else to an gage our attention, our be short. The most prominent constellations in the est are Gemini and Canis Minor, in the northwest, Auriga, due north, Cassiopela below the Pole, Ursa Minor and Draco above, and the Great Bear almost overhead. In the north-east Lyra is prominent, and in the east Hercules, na, and Bolites. Scorpio is rising in the south outh is Virgo As our initial shows, there is not the slightest resem blance in the stars to the figure for which they were

We may note the bright star Spica, a spectro pic binary at a great distance from us, and the double star  $\gamma$  (now close to Jupiter) which is now separable with a small telescope, but in 1835 could hardly be seen double with the largest instruments then existing. The two components were then at the closest point of the very eccentric orbit, in which they revolve about one another in some 180

RIGHT SKY: APRIL AND MAY

nearly 15 million miles of it will be there to exert any possible effect on the sun's light. Even so, it will not be surprising to many astronomers if nothing unnaun) is detected.

usual is detected.

Such negative results will however be actentifically valuable, since they will enable us to say that the materials composing the comet do not exceed certain limits of mass or density

Transits of comets across the sun are very rare.

The most remarkable previous instance is that of the survey comet or the survey comet of 1812, which, longing no bright that it

could be seen close to the sun in broad daylight with the naked eye, vanished completely when in frost of the sun's disk, showing that it was practically per-

# NATURE AS AN INVENTOR

## BY PERCY COLLINS

Civilised man justly prides himself upon his numer-cus invantions and mechanical devices, but it is possi-ble that inventors in general would beast less of their achievements did they realise that the patents in which they have established their rights are easily nothing more than modern reproductions of earlies which have been employed by Nature from the beginning of time It is a fact that there is exactly an invention of man that has not its prototype in Nature Semetimes these prototypes are of a rengh-and ready character. More often, however, they have been brought to the highest pitch of perfection. It is little short of amasting that primitive man should have remained blind, through so many centuries, to the significance and value of these inventions of Nature. It is have been said that aimost all of man's achievements as an inventor have their prototypes either in the ani and or vegetable kingdom. Othously, therefore, it would be impossible to attempt—in the limits of a soft article—anything approaching a complete exist which they have established their rights are really le—anything approaching a complete cata Yet a few of them may be lorge of these coincidences

selected, almost at random, and they will serve to show how, after much labor and thought, man has perfected devices which at the time appeared to him to be original, although in reality they were nothing

As a first instance we may take grasping toolswhole tribe of implements ranging from surgical forceps and sugar tongs to gasfitters' pliers and the vast pincers by means of which great masses of white-hot metal are manipulated upon the glant anvils of our workshops. It is a arcely too much to suffrm that, without such tools as those, art, science and manufacture would long ago have reased to advance. The reader needs only to pause for a moment to realize how important a part is played by these familiar imple-ments in the activities of human life, and when man kind first discovered how to make and use such things he must have benefited instantly Yet all these tools have their parallels in Nature, and one is fain to imagine that some of these prototypes might still supply useful hints to modern toolmakers

most perfect example of the powerful pincer in Nature is the claw of a crab or a lobster. The power of the crab's claw is so great that a bite from a large crab will inflict a severe injury. It is related that fisher men who have been feeling for crabs in the recesses men who navo been receiving for trans in the recisions of the rocks at low water have or assimilarly had their hand seized by a large specimen, and being unable to liberate themselves have been drowned by the returning tide. Among other pinter-carrying animals are scorpions, while the inserts known as carwings carry a dainty pair of forceps at the end of the body, and emules the totals for feldibut belts runni, and dell. and employ the tools for folding their smple and dell and employ the tools for folding their simple and deil cate wings. The oppossible thumb and for finger con-stitute, in effect a most useful pair of pilers adaptable to many uses and it is strange that man should so long have overlooked the lesson in mechanics which Shears and scissors are of course closely allied in principle to grasping tools yet they have come to us only with the advance of civilization—no savage tribes having the least idea of them or their (Continued on page 384)

These six young ones are the nucleus. They are regarded as offering great promise. Certain of one regarded as outering great promise. Certain of them combine the docility, strength and utility of the mother with the spirit, activity and boasty of the father. The yearlings are already larger than their mother. They are beautifully built and should be adapted to the many uses to which the domestic ani

## TROCHA CUTTER

A soldier in the Spanish and Philippine wars, who

had abundant experience in squeavering to an increase the wire entanglement of the Spanish trodus, has recoming devised a very simple cutter which may be aging plied to the bayonet of the gun. A soldler in action will desnounther himself of everything except his gent

WIRE-CUTTING ATTACKMENT FOR CURL

and bayonet, and hence the pilers which are usually furnished for cutting barb wire obstructions are from quently thrown away, so that the only method of get-ting through an entanglement when encountered in ting through an entanglement when encountered is to hammer the wire with the bayonet and a stone. Not only is this process slow, but it is fatal in a galling life for this reason the inventor has devised a cut-tor which may be secured to the bayonet without interfering with the use of the gun and which will op-erate to sever the wire by a single thrust of the weapon. crate to sever use wire by a single tartest or use weapon.

As shown in the illustration, the outler consists of
two jaws pivoted eccentrically so that when extending forward in their normal position they are open,
but when pushed back they close in sportsion, the
gun is inverted, the point of the bayonet is rested as gun is inverted, the point of the bayonet is resided on the wire, and then the gun is thrust forward with bayonet sliding on the wire so as to guide the latter between the jaws of the cutter. As the jaws are thrust back they close upon the wire and sever it.

DÖNTGENOGRAM OF A FULLY DRESSED MAN. The range of visible rays from deep red to violet forms a very small part of the solar spectrum Beyond the red, the rays are too long to affect the retina, but we can detect them as heat. At the other end, we have the ultra-violet rays which are too short to affect the the ultra-violet rays which are too short to effect the retina, but manifest themselves on the photographic plate Richigen rays are not fround in scullight, but if they were, and if our year were so constructed that they could detect only these rays, visible matter about an would take on a very different aspect from that to which we are accustomed. The accommanying illu-ration shows how a man would appear. The man ap-tention shows how a man would appear. pears semi transparent and one can easily make out his two watches and chain, his tie clip and the buckles of his suspenders. The metal parts of the buttons on on his suspenders. The metal parts of the buttons on his coat are also quite evident, and his ribs may be plainly seen. A pickpocket might envy such power of discornment, but he would have difficulty in conceal-ing his plunder if others were possessed of similar

The photograph was taken instantaneously with a Snooks apparatus, and is reproduced from "Archives of the Röntgen Ray" Heretofore, it has required a long exposure to take a photograph with the Röntgen rays, but recently a system has been devised by which long exposure to take a photograph with the Rintgen rays, but recently a system has been devised by which a very sudden and powerful discharge is produced capable of making an instantaneous photograph. This sudden discharge is made by using a tuse in place student uncharge in made by using a tube in place of the interrupter of an induction coil. The tube is melted when the proper intensity of current is reached, producing a very sudden break of the primary and a powerful discharge of the secondary Exposures of 1/50 to 1/120 of a second have thus been obtained.

DESTRUCTION OF A PRESS NO.

# It is Easy to make advertising

claims for cars; but to make cars that will make good the claims is hard.

We ask automobile buyers to do this: After the advertisements have attracted your attention, then in fairness to yourselves and all the manufacturers, compare the cars point by point. That is all we ask.

There are Chalmers dealers in all parts of the United States—more than 200 of them. We suggest that you get in touch with the one nearest to you at once. Let us send you his name if you do not know him.

# Chalmers "30" \$1500

Judged by price alone you might as well buy some other car as a Chalmers: \$1500 is simply \$1500—no more in one bank than in another, no more in bills than in coin, no more in your pocket than in another man's.

It is only when you begin trying to buy something with your money that the sense of value enters your mind.

Your \$1500 is worth more than another man's \$1500, if at all, only because you are able to buy more with yours than he can buy with his.

We believe that when you buy a Chalmers "30" your \$1500 becomes worth more than \$1500 invested in any other car. Careful investigation will convince you of this fact.

Please remember you are not buying a price or an advertisement: you are buying a car. Therefore examine the car on its merits.

If you investigate thoroughly a Chalmers will be your first choice, if you are able to get a delivery in your territory.

It is difficult to get more in a car, at any price, than you can get in a Chalmers "Forty" at \$2750. The "Forty" has all the power one can want, the quality to endure, beauty of line and luxurious finish. Seats for seven if desired. Catalogue "R" on request.

## THE MEATERS IN MAY

# (Concluded from page 378.) copes of sufficient size to pick up beint greenish disk of the planet.

the faint greenish disk of the planet.

The moon is in her last quarter at 8 A.M on the 2nd, and is new at midnight on the 3th (during the solar collipse visible in Australia). She reaches her right on the sut (units). She reaches her first quarter at 9 P M on the 15th, is full during her cellpae on the night of the 23rd, and comes to the last quarter again at 5 P M on the 31st. She is nearest us on the 8th, and farthest away

During her circuit of the sky al During her circuit of the sky she passes close to Venus on the 5th (and likewise near the comet the same afternoon), to Saturn on the 7th, Morcury on the 10th Mars on the 13th (pretty close), Neptune on the 13th, Jupiter on the 19th, and Uranus on the 28th Princeton University Observatory.

## MATURE AS AN INVESTOR.

(Continued from page 379)
use Those admirable workers in skin,
the Kaffirs and Eskimos, employ only
knives. The idea of the knife edge in mbination with the leverage afforded by tools of the grasping type had nover occurred to them Yet shears are exemplified by the jaws of many insects, as well as by those of tortoises and turtles only of comparatively recent years has man made boxes in which to store money, trinkets, or other valuables Yet Nature has had her boxes from time im memorial Some of the most interest of these take the form of seed-pods as, for example the stout casket in which Brazil nuts are packed. In this instance, too, the primitive idea of the puzzle—later elaborated by the Chinese as well as by other races of mankind-seems to lie dormant, for here we have a vast number of nuts, so eleverly packed pod or casket, that if or they are taken out it is almo at imi

The hings as attached to a lid or door has been known to man only for centur-ies, yet Nature has made use of it liter ally for billions of years. In proof of this statement, it is only necessary to inte a bivalve shell, such as an oyster or a clam. We know from goologic that such shells are among the earlie indications of life upon this earth with which they are acquainted The eggs of which they are acquainted the eggs of many insects, too, open with a vory per-fect little hinge, while the little lid which covers the cunningly contrived mest of the trap-door spider, is also hinged in a most ingenious manner by ne of silken bands

Savage man had no means of preser ing light for himself after the settling of the sun, and it was only with the slow progress of civilization that he became inspired with the idea of artificial illuministion. Yet this was not for want of examples set by Nature, for many and mais carry about with them bright lights during the hours of darkness. Marine during the hours of darkness. Marine organisms. In particular, emit phosphorescent radiance, while many kinds of insects, to which such names as glow worms, firefiles or lantern-dies have been applied, are highly luminous. In many instances the precise manner in which applied, are nigaly luminous. In many instances the precise manner in which the light of these creatures is produced has beffed scientific inquiry. Still, the fact remains that Nature had her living glow lamps ages before man emulated

Formerly the surgical operation knows as cupping was so constantly performed that searchy any man statused middle age without undergoing it. The object in view west the reutorul of the object from some defaults good; the surgion, by means of the appearant, acting a stone parter by the surgion, by means of the appearant of the surgion, by means of the appearant of the surgion, by means of the appearant of the surgion of the surgion before presents to the sufficient the operation of the surgion of very well nave invested this operation.

mitted in seeds case. Indeed, many of any most seed of the seeds of th

or less perfect vacuum. I like the old fashioned cupping glass the well known toy known as the 'sucker,' reminds us of the octopus By means of the sucker —a small circle of moist leather with a d-large stones may string attache lifted in exactly the same manner that lifted in exactly the salte manner con-the octopus dislodges rocks or holds down its struggling prey That compara-tively modern invention the pneumatic peg is an almost identical device peg is an almost identical device. The apex of the peg is fitted with a sort of a cup made of Indis rubber. When this is pressed upon a smooth flat surface, such as a pane of glass the air is forced out of the cup and a vacuum formed. The pressure of the atmosphere then causes the cup to adher to the glass with aufficient force to enable objects to be suspended from the peg. Further the man who had studied the octopus

might have added to the inventions at

atmosphere and the creation of a more

might have added to the inventions ai-ready enumerated, that of the common pump, which raises water simply by the action of the atmosphere That well-known device, the ball-andsocket joint without which many of our instruments and tools would be clumsy and impracticable, has many prototypes in Nature Perhaps the most familiar of these is seen in the articulation of the human shoulder bones—or, indeed in the bones of many unimals for the marvel ous flexibility of the snake is rendered possible only because the vertebra of this reptile constitute a long chain of balls and sockets beautifully adjusted one to the other Another very perfect exam-ple of ball-and-socket movement is found pie of oan-ana-socket movement is round in the case of the sea urehin Bach of the spines with which the shell of this creature is covered is swollen at the base into a cup-like form and this cup fits accurately upon a little rounded promi sence of the shell, which exactly fits into the cup just as the ball of the human the cup just as the ball of the human high bone fits into the acctabulum. The legs of insects in their articulation to the body supply examples of the ball-and socket principle too numerous to men

The idea of the flask or bottle is emi nently natural—I e it has played a part in the economy of Nature from time im examples are to be found in the vegetable kingdom among the plants known as gourds, the seed vessels of which assume forms calculated to remind the least imaginative individual of antique pot

We have already seen that the theory of the common pump might have formu lated itself in the mind of man after he the octopus There is moreover a pro-totype in Nature for that far more complicated device known as the force-pump This prototype is the human heart Anatomists agree that it is constructed on principles which are marvelously upto-date. In an incredibly short period the whole of the blood in the human hody passes to the heart and is driven from it again with a force which carries the stream to the tips of the fingers and toes, while as everyone knows the action of the heart persists, night and day, throughout the whole life of a man

throughout the whole life or a man a we regard the heart as the prototype of force-pump wrought in metal by the hands of mankind we must still be impressed by its immeasurable superfority its renovation and repairs are affected while the mechanism is in rapid motion. The simplest form of sewing is that which is in vogue among such primitive races as the Eskimos and Kaffirs It con sists in boring holes through the material sists in boring holes through the material which is to be joined together and push-ing the thread through them. The reader will observe that the operation is of so rough-and ready a character that no nee-dle is required, and one is almost tempted to imagine that mankind might actu ally have copied this method of sewing from having observed the manner in which the tailor bird constructs its nest

25:03

the pocket like receptacie thus formed in method the working scale that it is method the working scale that the sharp-pointed back is used to form a silt or hole in the leaf, and through this spices of tough grass, or other vegetable fiber, is passed A second hole is made and the natural "threed" is drawn through it, and so on until the work is completed by a tucking in and adjustment of unruly ends fibouid the reader completed by a tucking in and adjustment of unruly ends fibouid the reader and the state of the state o

also their prototypes in Nature The ma jority of nest-building birds exhibit a ore or less strongly marked weaving stinct. This instinct is most strongly developed in the case of a genus of finchlike birds indigenous to the warmer parts of Asia and Africa The spinning of fine threads so as to form thickor strands and the combination of these inwebs, are operations characteristic of many insects and their ailies Many spiders, as everyone knows, construct sliken webs which they employ as a means of capturing their prey, or of protecting their egg-clusters from injury But it is among insects of the sub-order Heterogram has been brought to the highest state of tice be termed the first spinners tice be termed the nist spinners—the in ventors under the guiding hand of Nature of this invaluable art. Take, for example, the cocoon of the well-known Cecropia moth—the so-called American silkworm It is entirely constructed of silk, which is secreted by glands in the mouth of the grub or caterpillar As soon as the insect me full-fed, and is about to pu pate, it sets about the formation of cocoon and labors unceasingly until it is The exact method of construction is so intricate that considers tions of space forbid us to describ detail. Suffice it to say that the pillar first constructs of sliken threads a kind of scaffolding, or framework, and then-laboring from within-goes to and fro about the skeleton structure deposit-ing its endiess sliken thread by means of a figure of eight movement of its head in this way a kind of tent of marvelous toughness is built up, wherein the cater-pillar changes to a chrysalis and passes andely through the quiescent period of its adult moth

and the reader may be reminded that many kinds of caterpliars contrive a kind of trap at the month of their comes similar in principle to those made by man for the capture of crabs, lobaters, and cels Within the neck of the Respect Moth's exceen, for example, there is a conteal arrangement of tooth, bristly appendages which form a well-nigh time penetrable barrangement of tooth, bristly appendages which form a well-nigh time penetrable barriangement of the states of camules which may attempt to force an extrance from without Yet owing to the feedbling of the community of these appendages, the fully civiliar of the cocons with perceive that the may not of the cocons with perceive that the trap of a moth's or the familiar lobaterpoid—a device which is employed by fahermen in many parts of the world to well as the second of the world as the second of the world as the second of the world of th

The writer is not sware whether Neture's contrivance of a box that cannot rell off a shelf has ever been put to pracical use by mankind it is obvious, however, that such a device might very well form the bests of more than one well form the bests of more than one well form the bests of more than one be studied by all those who are able to wist the rockly ledges used by sea fowl as breeding places—or, indeed, by those (Constituced on sepace Size

Don't Play with Fire

A COMMON caution to children but also good for grown men and women. You are playing with fire when you insure your property without carefully selecting the company which promises to protect you against loss. Companies differ just like individuals. Why take chances when, at no extra cost, safety can be had by simply saying to your agent when your insurance expires, "Get me a policy in the Hartford."

The Hartford Fire Insurance Company is the best known of all the fire insurance companies in America. For a century it has promptly paid every loss, the aggregate now amounting to more than \$130,000,000. Its reputation for fairness is unexcelled. Its resources are never in danger from the hidden rocks of stock speculation, because invested only in the safest securities. One hu. Leed years of life and growth have demonstrated its able management and unshaken stability. You are not playing with fire when you

(Continued from page 185)
who care to experiment with the exp of these birds on an ordinary shelf or table If one sets a fowlarge rolling on a table, the odds are in favor of its falling to the ground. Not so however, with the eggs of leider frequenting sea birds. For the forms of these eggs are designed so carefully by Auture, that it is virtually impossible to impart to them any but a civil air movement. If disturbed these eggs roll round and round until the impartang that to them he sepended. It is warroly necessary to ditting upon the importance of this de-If one sets a fowls egg rolling dilate upon the importance of this vice inasmuch as such eggs, being laid on the narrow ledges of perpendicular rocks would-but for their peculiar form be precipitated into the sea upor for their peculiar slightest movement of the parent As it is careful observers have pird As it is caretin observers nave stated that although there is a constant coming and koing among the birds and a constant rotation on the part of the

ggs not one of the latter is dislodged The stings and mouth parts of insorts typify in many ways the devices and inventions of man. The sting of a hour part of a hou ventions of man. The sting of a bee or a wasp might well have been taken as a model of the modern hypodermic syringe, so too, might the claborate ar rangement of blades and saws by means rangement of blades and saws by means of which the female mosquito makes and enlarges her puncture. The instru-ments, fitted together and working in unison, form a tube through which the insect sucks the blood from her victum and incidentally inculates him with malarial fever The several parts of this instrument are shown modeled on a greatly magnified scale in the accom panying photograph The fact that the a sheath when not actually in use is of especial interest, for herein we see typi fied the sheath or scabbard by means of which mankind protects the keenness of his edged tools and weapons A still more perfect type of the hypodermic syringe is the fang of a poisonous snake When the reptile makes its stroke, the base of the fang is driven against a reser voir with the result that the liquid poison voir with the rault that the joint possess is driven through the tubular fang and forced into the wound. Even in the case of large snakes, these deadly weapons are surprisingly slender and delicate, so that the wounds made by them would be quite inconsiderable were it not for the fact that a deadly liquid is injected-exactly as is the case with the hypoder

mic syringo
There are many natural devices by
means of which plants and animals travel through the air and mankind is at travi through the air and mankini is are present engaged in a close study of these with a view to perfecting his own air ships and flying machines. The creatures whose appearance and habits resemble balloons most closely are the so-called globe fishers of tropical areas For the most part their bodies are covered with strong spines, or at least with hard plates, but the strangest characteristic of these ocean dwellers is their power of dilating the gullet with air, w body swells out into a globe-like form and the spines are erected, furnishing a formidable protection When so inflated, globe fish are unable to swim They drift about upon the surface with underside turned upward, and skim over the waves impelled by the passing over the waves impelled by the passing breeze. It cannot be doubted that this singular habit reminiscent of the bal loon is beneficial to these fish in that it enables them to escape the onslaught of sharks and allied carnivorous crea tures of the deep

in conclusion, we may glance for a moment at Nature's own electric batter less—two remarkable examples of the capacity of animal structure to produce electricity to store it so to speak, and to discharge it at will Both these crea tures are fish one belonging to the sel tribe, the other bing a species of may known as the torpede fish. As a matter of fact the torpede rays belong to several species which are met with in the Allan (Concluded on page 187)

. (Concluded from page 386) tie, Mediterranean and Indian Oceans. The broad, smooth body has a rounded outline, and on each side of the head outline, and on each side of the head there is an electric organ capable of giv-ing electric shocks. The accompanying illustration shows one of these fish dissected to show the seat of its electric power On the left, the nerves supplying the organ are dissected away The prismatic areas on the surface of the organ indicate the vertical columns of electrical plates, of which there may be 500,000 in each organ. The arrangement of these plates, or disks, is like the metallic por tions of the voltaic pile while each is separated from its neighbor by a delicate mbrane, which takes the place of the to be to enable the torpedo ray appears to be to enable the creature to secure its prey either by killing it, or rendering it temporarily insensible—it is said that just before the shock is delivered, the eves are depressed in the head like those of a toad when swallowing a large in-

The electric eet of Southern America stimes attains a length of six feet, and its electric organs are proportionate by four times as large as those of the wrped when about to deliver its shock & points its body in the direction of the intended victim, stiffens itself and with a sort of shudder, the electric fluid is emitted. It is said that the flah which is the object of the discharge rarely or never escapes but simultaneously with the shudder of the sel turns on its back and lies motionless—an easy prey to the electric monster

It would be possible to dilate at much greater length upon the natural proto-types of human inventions. Enough has been penned, however, to show how fre quently man's thoughts reflect the de quenty mans thoughns reflect the de-vices which aiready exist in organic na ture. The moral to this should not be far to seek. If so many existing hu man invontions have been anticipated by Nature, we may conclude that with Na ture lie the secrets of inventions yet to come, nor can it be doubted that a close study of animal and plant life will from time to time bear fruit in the form of mechanical devices which will prove of inestimable value to mankind at large for this reason, if for no other, the in rulcation of Nature study in the minds of young people is highly desirable

### THE MICE AVIATION MEET.

(Concluded from page 372) made but one stop, at Litchfield started readily from that place at 4 09 A M and covered the remaining 68 miles in 1 hour and 21 minutes beating the train that accompanied him. The last 24 miles were flown in 24 minutes on account of a favorable wind. Bight thousand people are reported to have watched him arrive d the remaining 68 miles in and to have given him a rousing wel

Next to the Biériot Latham race across the English Channel last July, this cross-country flight is the greatest achievement so far in aviation In the light of what has already been accomplished it would seem that from 800- to 1,000-mile flights without a stop for fuel are now quite sible of accomplishment the only limiting factor being human endurance both his attempts at flying from Lond both his attempts at flying from London to Manchestre Graham White was obliged to give up on account of the great strain undergone by him in maintaining the equilibrium of his biplane in the strong and gusty wind When some device is provided which will maintain equilibrium automatically, the strain equilibrium automatically, the strain upon the aviator will be greatly relieved and driving an aeroplane will then be no more fatiguing than running an auto-

Sicostive powder is prepared by mix-ing 30 parts of lithopone, 30 of sine-white and 40 of manganese borats. Past the whole through a fine steve. This pow-der is a good drier for white paints.

NEW QUEBEC BRIDGE DESIGN

CCORDING to a recent dispatch to one of the New York dailies the Queber Bridge Board after extended investigation has approved a plan for the superstructure of a cantilever to take the place of the one which collapsed severally care sage it is also amounced that tenders for construction will be accepted either on this design or on satisfactory alternative designs submitted by bidders. It is stated furthermore that the Dominion bidders. It is stated furthermore that the Dominion government will require not only that the contracting

firm accept full responsibility for the project whether it be constructed on the Board's design or from its own plans, but also that the firm make a very large cash deposit as guarantee of successful compl

The design now approved by the Commission The design now approved by the Commission says the dispatch is that which was sharply criticised a few months ago in an American selentific periodical", and we are informed in this connection that the Cana-dian government has desided that the criticism then made did not justly apply. We are further told that "the Board while convinced that the designs will make

a safe and satisfactory bridge is not disposed to close

e door to other designs.
Since the Scientiff American is the only jour that has printed the plan of the new design drawn up by the Board and subjected it to extended criticism we presume that we are the American scientific periodical referred to. The plan and discussion was printed in our issue of February 12th, and our readers will remember that we took exception to the design on the ground that it was not only of inferior merit consid ered from the bridge engineers standpoint, but that if constructed it would be the 'ugliest bridge of monu If constructed it would be the "uglete bridge of mount mental proportions among those hilberts proposed or built. Objection was also made to the design on the ground that be same of its narrow width it would not have sufficient rigidity the Forth bridge, which is of loss again, having a ratio of width to length of 1 to 14 whereas the Quebec bridge would have a ratio of only 1 to 20. We objected further more, to the height of the towers, which in the Barri's design in to be only 20 feet as against a beart's design in to be only 20 feet as against a col of 140 feet in the Forth bridge. We showed she that the effect of low height and narrow width lean to unduly increase the weight of the structure of Quebe bridge requiring the resonance average the Queber bridge requiring the enormous average weight of 24 (one of steel (half of it nickel steel) per linear foot as against a weight of only 10 tons of carbon steel per linear foot in the Forth bridge—an increase out of all proportion to the heavier loading of the proposed Quebec structure
The value of the Board's decision to invite outside

designs depends upon the length of time that is sllowed to bidders for the proper preparation of plans for a structure of this great importance. The Board for a structure of this great importance. The Board has laken about low years to prepare its own plan, and if outside bidders are to be limited to a few mompha time it is searchy likely in view of the heavy penalties imposed that they would be prepared to put his bid with his properties in the property of the property of the property of the property of the competition to be thrown to getter very hearity. If the competition to be thrown one to the definition and mirridge builders of the United States and Europe not only should abundance of time be given for the working up of the necessar plans and estimates, but it would be advisable for the plans and estimaton, but it would be advisable for the Canadian government to arrange for the plans, both of the Quebec Bridge Board and of outside bidders, to be subjected to the award of an independent Board, pre terming international in character YURL ROOMOMY AND OUR NATURAL RESOURCES

IE problem of preserving the natural wealth of the country may be attacked from two sides, the legislative and the mechanical. The operation of the first method may be seen in the admirable movement of the Federal govern ment to prevent the ruthless waste of the country's ment to prevent the ruthless waste of the country a matural resources which results from the improvident methods by which they are gathered from mine, field, and forest Only posterity will be able to estimate at its full value the revent legislation for the conserva-tion of that natural availth with which the United

States has been so richly endowed

But after the fostering care of the government has done all that it may to conserve by the prevention of waste it remains for the consumer to so utilise the raw materials, as to obtain from them the maximum raw materials, as to obtain from item to maximum amount of meful output, whether in the form of power or of finished product, with the least possible amount of wastage. This indeed, is one of the most impor-tant and attractive objects of effort in the great industrial world. To the engineer of high professional in stincts it is not sufficient to do a certain work and do it fairly well, rather, it must be done with as close an approximation to perfection as the conditions of

Economy of performance has been the constant aim of the industrial engineer, particularly in recent years, and from time to time we have recorded in these pages (crisin successive steps some of them epoch making in their importance in this constant on deavor to bring working efficiency into closer approxi mation to theoretical efficiency. What we have said applies with particular force in the field of steam en gincering in which it may be said that at the last analysis the object of all improvements is to lessen consumption of fuel for a given amount of work. Fuel economy, moreover apart from its direct connection with the profit and loss account of any industrial enter prise has a most important bearing upon the ques of the conservation of natural resources tion of the conservation of natural pressures. The world's coal supplies are by no means unfillmed. The consumption entering at an acceptant part is not every reduction that is made in the average amount of fuel which must be burned to sever a given amount of sort we mean that the life of our coal and oil fields is prolonged to existly that start.

At the present time there are two important develop ents which promise to give economical results whose cases they have to do with the transportation of freight in bulk, the one relating to the engines of slow speed cargo beats the other in the motive power of those freight frains which are so characteristic

The reduction in the cost of transporting water horne freight has been made possible, or soon will be by the successful application of mechanical reduction gear to cargo ships of moderate speed—a problem to which some of the ablest engineers and the most renowned manufacturing firms in the world are now do voting close attention. MacFarland and McAlpine, and Westinghouse, in this country, and the Hon. Charles Westinghouse, in this country, and the Hon Charles Parsons in England has indeependently produced a gear which will enable slow and moderate-speed steam ships to utilize the highly co-commital fast running stram turbine for driving slow-speed projection with a loss of efficiency in the transmission pear of only two per cent. Parsons has gone so for as to test the new installation against the old reciprocating regation, in a cargo ship of 4 500 tons displacement, and he has proved in a series of comparative tests that the cargo ship of the future can be driven at present speeds with a saving in the coal bill of from 17 to 20 per cent Now since about two thirds of the world's shipping are made up of freight steamers, it can be seen that when some form of this system has been generally applied, as it undoubtedly will be, there will be a great aggre reduction in the consumption of fuel by the world's merchant marine For fuller information re-garding this epoch making device, reference is made to articles published in the SCIENTIFIC AMERICAN OF Feb-

articles published in the Scientific Aurenta of Ph-roary Talk and April 23rd of this year Gousily important are the economies in the trans-portation of rained freight which are now rendered possible by the perfection of appliances for the use of superheated internal Although the application of super-heat has been practicated for several years in Surope, the of the perfection of the perfect of the per-turbation of the perfect of the perfect of the per-turbation of the perfect of the perfect of the per-turbation of the perfect of the perfect of the per-turbation of the perfect of the perfect of the per-turbation of the perfect of the perfect of the per-pendicular perfect of the perfect of the per-pendicular perfect of the perfect of the per-turbation of the perfect of the perfect of the per-pendicular perfect of the perfect of the per-turbation of the perfect of the per-pendicular perfect of the perfect of the per-turbation of the perfect of the per-turbation of the perfect of the per-pendicular perfect of the perfect of the per-turbation of the perfect of the per-pendicular perfect of the perfect of the per-turbation of the perfect of the per-turbation of the perfect of the per-pendicular perfect of the perfect of the per-turbation of the perfect of the per-pendicular perfect of the perfect of the per-turbation of the perfect of the per-turbation of the perfect of the perfect of the per-pendicular perfect of the perfect of the per-pendicular perfect of the perfect of the per-turbation of the perfect of the perfect of the per-pendicular perfect of the perfect of the perfect of the per-pendicular perfect of the perfect of the per-turbation of the perfect of the perfect of the perfect of the per-turbation of the perfect of the perfect of the perfect of the perfect of the per-pendicular perfect of the perfect of the perfect of the perfect of the p good work that on one of our leading western roads, the Atchison Topeka and Santa Fe, superheated steam is being used on a number of the largest freight enin being used on a number of the harpest freight ca-pines with conspicuous success in a series of tests with two identical compound freight shighes running over the same stresh of read under identical condi-tions, one a 4-rylinder compound using entrysale rican, and the other a similar drylinder compound with a superheaster of the Jacobs type added, the rapper-heater sugine showed a decrease in coal, consumplied of 196 per cent for constant hard working on heavy of 19 8 per cent for constant hard working on heavy mountain grades; it gare an average of 11 6 per cent more dry steam per pound of coal than the non-super-bator engine, and the boiler and its accessories proved to have a total blather efficiency of 138 per cent. These figures were obtained by it MacPartand, the engineer of tests of the rational who explains the remarkable recommiss secured by the faute First, that superbested steam of high temperatures behaves addentified and the superbest of the superbest of the super-siderable, amount of, thest, before any conference in siderable amount of heat before any condensation takes place, secondly, that for the same cut-off in the value place, secondry task for the same culton in the vylinder, the weight of steam required is less with superheated than saturated steam of the same pres-sure, and thirdly, that, as compared with saturated steam superheated steam has greatly reduced thermo-conductivity, and the amount of heat absorbed by the cylinder walls is only a fraction of what it would be were the steam saturated. The details of this system of superheating as applied to locomotives of the Mallet will be fo und in an illustrated article published in our issue of January 29th of the present year

in our issue of January 29th of the present year.

Important as are the economies that have been under

possible in the broad field of transportation, they are

exceeded in the even larger field of stationary engineer

fing represented by the huge light and power plants

for municipal and manufacturing service where the utilization of the exhaust steam in low-pressure tur-bines has made possible economies of from 30 to 100 per cent-this last result having been attained at the rge station which furnishes power for the New York

DOTE RADIUM RESET IN THE PURE STATE !

HK French scientist G Le Bon doubts whether metallic radium exists In fact, we are only acquainted with the saits of the suppo metal such as the chloride or bromide the probability of its existence is deduced only from the presence of some rays of the spectrum and an atomic weight which is somewhat theoretical seeing atomic weight which is somewhat theoretical seeing that It has varied according to the observers. M. Le Bon has been of the nylmion for eight years past that the existence of radium is doubtful. He considers that the properties of the supposed metal might be due to certain unknown combinations analogous to the equally unknown combinations which give phos phorescence to some of the sulphides. It is observed phorescence to some of the sulphides. It is observed in fact that a jurie sulphide is never phosphorescent, but when mixed with some traces of different bodies in becomes brilliantly phosphorescent. This point has been discussed in various papers presented to the Academie des Sciences. If has do casion to mention has views about radium to the late Prior Moisson, and this well known the bright had not be suited to the same the prior of the surface of th conclusion, having the idea of separating radium from its compounds. Death overtook him before he could carry out these researches. A tenth of a graugue of substance would be needed by a good chemist, but probably several operations would be required in addition An expense of \$10,000 would be incurred Mile Bon thinks that from chloride of radium we would extract simply barium and nothing more. The ex-periment, even through transforming a body worth perfinent, who turough transforming a looy wound \$200000 a granume into a comparatively worthlose notal would be of great interest, for it would prove that radio-activity which gives out considerable force can be produced by certain combinations

M Georges Claude of Paris brings out the follow ing points regarding the future uses of oxygen, see ing that this latter is now being produced on a countercial scale from liquid air. He shows that oxygen can increase by 40 per cent the yield of the reactions which serve as the base of the fixation of nitrogen by the olectric are, and it can improve the magnifecture of oxone by nearly 300 per cent. Buth results promise to be of great interest in many of the industries. The Balgian firm of Ougree Marihaye has revently ordered from the Paris Liquid Air Company three apparatus from the Paris Liquid Air Company three appearatus for producing oxygen, and these such have a yield of 500 cubic yards of pure oxygen per hour. Such appearatus will be used for experiments in blast furnace working, to observe the action of a considerable province of oxygen mixed with the sight which is sent purposed to the period of the period oxygen appearatus of the places. He was not to using expen appearatus of the places that only the period oxygen appearatus of the places. where the may could upon a pyratus of the present kind and we may could upon a piece of 040 cent per cubic yard with apparatus of a large output such as we mention However, even larger apparatus on the belit in which to loss than 1,000 cubic yards of mas jecin which no less than 1,000 cubic yards of ma jet hour can be produced, working at a pressure of the hour can be produced, working at a pressure of the atmosphered and furnishing 1.5 males seek the price per cable yardwill fall as jew at 8.5 cept. By using hybridgh given will fall as jew at 8.5 cept. By using hybridgh given the cost of production, sits a left; lowered. Degree plants of the pressing fixed will be of great advantage in the way of manife these companies on the production of the p

### ELECTRICITY.

Vin Rochester, R. T., a good exprism of electric light and telephone viring its mas, whereby unsightly pole lines on the streets are done sway with The system is applicable childry to the residential districts. The lines are placed in underground conduits in the streets but instead of making connections with the houses directly from the underground conduits, a pole line is erected in the back yarde of each block and this solid line is in the latter of each block and this solid line is at each side street. This obvitates the necessity of having a mashabo in front of each house.

An application was recently made for a permit to any conducts along the new Hallitmer and Willings to recent a permit to the product and produ

Storage battery locomotives in being used in certain mines of Crimany. These locomotives are considered less damperous than the ordinary levish locomotive for the rason that no string is necessary in the mines and they can be incase of completely to present ignition of games by means of a chaine squark. The locomotives are each provided with two sits of hat tries one of which is being charged while the other is operating the locomotive. The batter has an addomner than two thirds dish harged with at the other large large dark the charging takes but a short time. In one type of locomotive of tworty horse-power the batteries contain ninery cells each with a capacity of 71 ampert, hours. The storage battery locomotive range from 8 to 52 horse storage battery locomotive range from 8 to 52 horse

Whenever a ablt message Is not to an Inland city, it is necessary to trans this the message from the table receiver and re-transmit it to hand over the land lines to its point of destination. Hereafore, it has been impossible to send a message direct to the hand city by mans of relay connection, with the overland wires for the reason that the sable sizes are of too fluctuating a thereafter and too smithly to operate an ordinary description of the same of the

The installation of a complete blephone system for the stage of the New Thesier in this city literative not only the variety of uses to which the telephone is put but also the vastness and complexity of the update stage. The stage telephone system has nine rist tions on the stage and twenty for floor stations with two switnishards or central stations. Through these centrals inter-communication with the other stations may be had. From one of these centrals inter-communication with the other stations may be had. From one of these centrals interested in the station may be had. From one of these central stations while the other board is the stage manager station. The regular stations are placed in the purpose attain. The regular stations are placed in the post of the station that the station is the stage station and the central stations and they serve to flesh is bull-system of the central stations and they serve to flesh is bull-system of the central stations and they serve to flesh is bull-system of the central stations and they serve to flesh is bull-system of the central stations and they serve to flesh is bull-system of the central stations and they serve to flesh is bull-system of the central stations and they serve to flesh is bull-system of the central stations and they serve to flesh is bull-system of the central stations and they serve to flesh is bull-system of the central stations and they serve to flesh is bull-system.

The Pennayiwala's tansed and terminal signal in stallation is the largest single installation of its kind ever made in this country. While most people realize that signals juy an important part in protecting train movements especially where traffic is congested, the investment made in these devices is far beyond the general understanding. Development in signaling in event years has been tremendous and has proceeded chiefly along electrical lines. Complete signaling and the signal control of the signal signal

### SCIENCE.

Prof. W. W. O. mpbill, director of the Lick Milery atory, has telegraphed to Harvard College Observators, that the bright sedium D line has been photographed in the spectrum of Halley a count by Wright.

Prof. Charles Chandler was honored in New York Sity recently on his retirement in his 74th year from approxservies—A banquet was tendered him at the Waldorf Astoria hotel. The banquet was attended by many of New Yorks most distinguished setentists.

Commander Peary's arrival in bendand was attended with much ceremony. A regiment of requesters much lim at Plymouth Members of the Royal Geographic call Society as well as the 1 ordion Navial Active welcomed him to London. With Commander Peary is tage Itaricia, who accompanied him to the public tage in the property of the property of the property of the Peary Brown of the Peary Pay the Royal Geographical Studies, and a replican subject to Capit Bartlett.

A later dated May led 1919 has been rectived at literact Other stater from 1970 D. W. Morehouse of Brake Lutversty, stating that. This morning at 6 crock fallay we come had a short bright tall projecting toward the sun. Two bright rave bordered ing toward the sun. Two bright rave bordered the non-training of about 86 degrees. The south preceding one was much the brighter. The notions was arrounded on the sun side with distinct notations should not the sun side with distinct notations should say the contraction of Cottober 1101 ISS was wishly recalled. A photograph of 11 influsive exposure showed a state of over 2 degrees in location.

The lowest atmospheric temperature erry observed, of 8 deg (\* 1 and deg F) was recorded on January 16th 1885 at Werkbolausk in Piastern Silteria a little morth of the Artic Circle. No lower temperature discussed in this has been experienced by any Artic to Antarctic expedition. A temperature of the separation of the expedition of the piastern of the separation of the degree of the separation of the degree of the separation of the cook who claims to have observed as importance of the degree (\* 1 degree of the degree

# The Porhydrometer—An Apparatus for Weighing Ship Cargoes

BY THE ENGLISH CORRESPONDENT OF THE SCIENTIFIC AMERICAN

An ingenious apparatus has been perfected by an Italian engineer, Signor Emilio de Lorenzi, the func-tion of which is to indicate automatically the weight of a ship s cargo This device, which is called the "Poris of simple construction and operation hydrometer, and works with remarkable accuracy—the results be ing within 0 001 per cent Moreover, it is easy of in stallation so that vessels already in service can be equipped therewith as readily as those in course of construction

The operation of the instrument is based upon the principle that a body floating in a liquid no matter its density may be displaces a quantity of that liquid exactly equal to its own weight. The apparatus comprises merely a float or "aerometer" pla meter" placed in a with the outside of the ship Consequently, as the ves-sel stake desper into the water while being loaded or the treat when the freight is bring discharged, the level of the water in the float chamber must ris in coincidence with the level of the surrounding liquid The float itself being fixed it become or less deeply immersed in the water in the chamber with a consequent siteration in its apparent we

The accometer is connected and balanced by levers so that by the adjustment of the balancing weights the volume of water displaced by the aerometer at any particular draught is accurately gaged the alteration in apparent weight being read on the weighting machine or recording instrument and therefrom the weight of any cargo taken on board or discharged is easily deter

The principle of the apparatus may be more com chensively realized by reference to the explanatory ustration which shows the mid-ship section of a vessel with the porhydrometer in position. The float chamber A is placed vertically over the longitudina and transverse center of the ship and extends from a point 11/2 to 2 feet below the line of flotation wi el is empty to a convenient height above the load This chamber is connected to the surrounding liquid by means of a smaller pipe B to a valve on the skin of the vessel, or to some other convenient ses water connection a special tube being unnecessary so long as an uninterrupted flow of water to the float chamber can be secured so that the water level within may be exactly as that outside the ship In the large float chamber A is immersed the

aerometer C being suspended from. and balanced by a horizontal lever D having its fulcrum at E the end being connected to a steelyard weighing machine at F. The aerometer is generally made beavier than its displacement, but this is immaterial since it is in a condition of equilibrium. The float extends downward sufficiently to bring its lower end below the plane of flutation for light leading and sufficiently far upward to bring its upper end above the plane for the maximum draught. Moreover, its profile is such that the area of the float at any point of cross section bears a constant ratio to the area of the ship at the same level
As the vessel becomes immersed

through the superimposition of any weight such as cargo, the draught increases and accordingly the wa ter in the float chamber rises to a higher level the secometer itself consequently being immersed deeper into the water, and by increasing its displacement reduces its appar ent weight as already mentic This difference of weight creates a downward pull on the opposing arm of the lever, where a counterweight remains unaitered As the steel yard is connected to the main lever

D by the rods or links the exact

amount of tension is registered that
is attributable to the disturbance of the balance on the main lever through the increased displacement.

The vital part of the invention lies in the acrometer Alteration of trim or inclination of the vessel cannot by any means upset the ac curacy of the instrument It to to short an absolute gage of the ves be placed right aft or forward will be weighed exactly the same as

ed near the center of the vessel, since the draught directly under the instrum urrugan surrectly unger ton maximum at the mean of that fore and aft. The whole of the parts of the apparatus are standardised with the exception of the acrometer, which must be properly designed and care-fully adjusted. Its form being made to correspond with that of the ship

us tests with the apparatus have been car ried out in England, and the accuracy of the weight readings, irrespective of the size of the vessel, have been remarkably conclusive It can be applied to

Recording instrument of the perbydrometer.

any type of craft with equal facility and infallibility— to a small lighter as easily as to a transatiantic liner At the present moment arrangements are being made for its installation upon a 10 000-ton vessel. In this case the diameter of the float will be about 9 inches case the diameter of the float will be about 9 inches For a small lighter it averages about 3½ inches diameter it the top by about 2½ inches at the lower extremity. So sensitive is the apparatus that it will indicate the weight of a person stepping on board

Thus it will be seen that the captain of a vessel always possesses a means of determining exactly the weight he has on board For those vessels engaged weight he has on board. For those vessels engaged in long journeys, necessifining bunkering at intermedial are ports, it is of far reaching importance, since it cables the capitain to sacertain precisely how much fuel he has shipped. This is a valuable point, has-much as at many foreign ports short weighting is by no means an uncommon practice, and vegsels are often mulcted for a considerable sum per annum in pay ments for misrepresented quantities of coal

The function of the invention is also carried to a further and important feature. It will inform the captain the exact weight of water he has in his ballast tanks. Also, should the vesed spring a leak the fact is instantly communicated to the captain by the apparatus registering an increased ment due to filling with water. In cases of collision and grounding the incursion of water is similarly con and grounding has incurrent of variety of statistics, veryed, the apparatus being equipped with an electric alarm bell, which conveys intimation of the danger to the captain. No discrepancies in the readings can be introduced by variations in the density of the water in which the vessel may be floating, for such cannot affect the fundamental principle upon which the ap-

It will be seen that by the introduction of the ap-It will be seen that by the introduction of the ap-paratus the ship itself is practically converted into a huge weigh bridge. The Italian government submitted the invention to searching tests and was so convinced. of the accuracy of the records that its customs authori-ties have been ordered to accept porhydrometer readings as correct. To the shipowner this is no slight ncession, since in regard to Italy, instead of paying 45 cents per ton in weighing dues, vessels fitted with the porhydrometer only pay 1 25 cents per ton

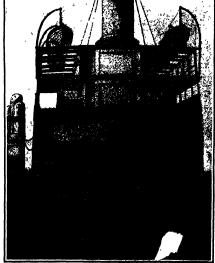

## uence of Phase and Retation upon the Brightness of Hiluminated Spheres,

The total luminosity of the moon varies accor to the proportion of its illuminated hemisphere which ed toward the earth, that is to say, in acco ance with the "phase" of the satellite. Mercury and Venus show similar, but smaller differences of phase and brightness. The exterior planets vary in phase so little that the variation in their brightness is barely perceptible The brightness of planets can be measured by the astrophotometer, and the dependence of the brightness upon the phase can be expressed by a As it seemed possible that some information in regard to the surface of the planets could be ob tained from the study of such curves, Von Aufsess has made a series of experiments to determine the relation etween brightness and phase in the case of illumin ated masses of limestone, sandstone, granite, and other materials of spherical and other forms The measure ments of brightness were made in a completely dark The artificial plant was illuminated by a h

lamp, not directly, but by reflec-tion from a plane sheet of glass, through which the object could be observed in the "full" phase The lamp and the reflector were mounted on an arm which could be turned around the object in order to vary the phase

When the results were plotted, the curves representing the bright-ness as a function of the phase were found to fall into two classes, according to the character of the material to which the globes were composed Globes of light colored material gave curves concave be-low, while the curves produced by globes of darker material are concave above Small elevations and depressions, glossy surfaces, etc., were found to produce comparatively little effect upon the curves, the character of which was, in general, decided almost entirely by the lightness or darkness of the sur-face. The curves produced by Venus and the moon are concave venus and the moon are concave above. Hence it appears probable that the surfaces of these two planets are formed of dark colored material—Prometheus.

In a recent issue of Nature the difficulty experienced in hot coun-tries in keeping small accumulatries in keeping small accumula-tors in working order is referred to, and it is pointed out that this is probably due to the cells being filled with dilute acid of deastly 1190 at a temperature of 20 des, or 35 deg Cent. While this is a proper density to use in a climate where the temperature is 15 deg.
to 20 deg. Cent., corresponding to
a 20 per cent mixture, it is too
high for a hot climate, where it
really represents a 23 per cent
mixture; a density of 1.176 or

## THE REW MITTEL PROPOSESPIED VALUE AND

hr secures perms.

Beagues, in order to measure the luminosity of the sun's disk, allowed a beam of sunlight to enter a dark room through a small sperture, below which a converging less was placed. The diverging cone of rays, beyond the focus of the less, was ing come of rays, beyond the locus or the lens, was intercepted by a screen, forming a circle, the bright-ness of which was not too great to be measured by the ordinary methods. The brightness of the sun was assumed to bear the same ratio to that of sun was assumed to bear the same ratio to that or the circle on the screen that the area of the circle bore to that of the aperture through which the light entered. At a later date (1844) Fineau and Fon-cault employed the photographic process which cault employed the photographic process which had just been discovered by Deguerre to compare the brightness of the sun with that of artificial sources of light. The quantity of light received by a unit of area of the solar image formed at the focus of a telescope is proportional to the clear aperture of the object glass. Fixests and Fuscanti received the image of the sun on an incided plate of silver. In successive experiments they varied the aperture of the objective and regulated the the aperture of the objective and regulated the duration of the exposure so that the final tint assumed by the plate and, therefore, the quantity of allver totaled decomposed, was the same in each case. In this way they proved that the required inversely in proportion to the aperture of the objective In total chemical effect was found to be (within the range of extreme of the objective). The total chemical effect was found to be (within the range of extreme of the objective) to the way to the total chemical effect was found to be (within the range of extreme of the objective) to the range of the property of the transparent of the same apparent diameter, of the positive earbon of an elec-

diameter, of the positive carbon of an elecdiameter, of the positive carron or an elec-tric lamp, they proved that the chemical effect is proportional to the brightness of the source of light. This relation, how-ever, did not appear to extend indefinitely, for the quantity of silver reduced, which was at first proportional to the lens th of the exposure, tended toward a fixed limit

then the exposure, tended toward a fixed limit, when the exposure was greatly prolonged. In 1881 the great advance which had seen made in photography enabled Janssen to employ very sensitive plates, in which the total chemical effect remained proportional to the duration of exposure proportional to the duration of exposure within very wide limits Jordan devised a heliograph in the form of a perforated crilindrical box containing a sheet of ferro-prussiate paper, and Richard constructed another instrument based on the photo-

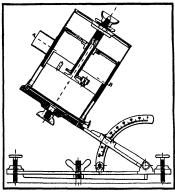

another instrument based on the photo-graphic action of the solar rays.

Campbell, on the other hand, made use of the heating effect of the solar rays for the purpose of measuring the effective an-nual duration of sunlight, I. e., the aggrenual duration of sunlight, i. e., the aggre-gate time during which the sun is not veiled by clouds, a quantity which plays an important part in the processes of vege-tation. Campbell's heliograph consists of a sphere of glass, mounted on a horisontal base, in a place exposed on every side, so that the

sun is visible from its rising until its setting. A groove in the spherical mounting allows the intro-

VERTICAL SECTION OF THE RIFFEL HELIOGRAPH.

duction of a strip of cardboard, which forms a circular arc at such a distance from the spherical glass lens that the image of the sun, formed by the lens, is

always on the strip The cardboard is carbonised by the concentrated solar rays at the spot where the image is formed and, owing to apparent diurnal of the sun a black line is traced on the card If the sun ablaces all day without inter-mission this line is continuous but If the solar rays are intercepted by feetling clouds the trac-consists of a number of separate portions the po-tions and lengths of which show when and hos-long the sun has shone. The apparatus is ceasily set up. If is nervesary only in level the base, i. i. places the non-line, marked XI on the rard oups-places the non-line, marked XI on the rard oupssite a fixed mark on the frame and to set the sate a nice mark on the frame and to see the in strument so that the sun's image fails exactly on this line at the instant of true noon. In the in proved form of the instrument designed by Stokes the frame has three grows, at different heights, in which three sorts of cards are placed. The shortest cards are placed in the highest groove and are used between November 5th and February 5th, the longest cards are placed in the lowest groove and are used between May 5th and August 5th, while the cards of intermediate length are placed in the middle groove and are used during the remainder of the year

Eiffel has recently invented a photographic re-cording heliograph which has been used for some time at the central meteorological bureau of France and at the Juvisy observatory It consists of a cylinder which is mounted on a shaft parallel to the earth's axis, and is turned

to the earth's axis, and is turned by clockwork at the rate of one revolution in twenty four hours. The sun's rays en tor the cylinder through an aperature in its convex surface which is surrounded by od for the exclusion of diffused light An inner cylinder, covered with photo-graphic paper, is supported by a nut which can move along the shaft of the outer cylinder which shaft hears a serew thread A guide, attached to the case of the clock work, prevents the inner cylinder from rotating. Hence as the outer cylinder turns, the inner cylinder is compelled, by turns, the inner cylinder is compelled, by the screw, nut and guide to more along the shaft without rotating. The photo-graphic paper is surrounded by a screen, which has various degrees of transpar the average intensity of sunlight at differ ent hours and seasons. As the outer cylin der rotates, its aperture is always directed approximately toward the sun and in consequence of the motions of the two cylin ders, the entering pencil of light traces a helicordal line on the paper which is wide enough to serve for a number of days. No sions (an be drawn from the photographic records made by the Effel heliograph until after the instrument has been in continuous operation for several

### GARDIN PROCESS OF PROTO-SCULPTURE.

The idea of employing photography as an aid to sculpture soon followed the in vention of the daguerrectype Fifty years ago Will ôme devised a process in which the sculptor's model was photographed simultaneously by twenty four

HALLEY'S COMET IN THE STREETS SET.

my many means notents, ret.s.

The average man will find by far his best opport The average man will find by far his best opportunity to see the comet, which has occupied so prominent a place in public attention, during the last ten days of May The accompanying map shows at a glance just what are the circumstances of its appearance. At first what are the circumstances of its appearance. At new its appearen motion among the stars is very rapid, but later, as it recedes from us, it seems to stand almost still in the sky . Its distance from the earth is in round numbers it million miles on the 20th. Tmillion on the 22th, 22 million on the 28th, and 45 million on the list, so that it will appear to shrink and grow visibly fainter from night to night,

grow visibly rancer rrow magns to mign.

In addition to the stars near the comist's path, and
the place of the compt for each night (at 10 P M
Eastern Standard Time, or P M Contral Standard
Time, etc.), the map shows the position of the horison among the stars at certain hours, so that it is
easy to estimate how high my they will appear at any time

The given position of the horizon is exact for

The given position of the horizon is exact for ob-servers in latitude 40 deg north (Pennsylvania, Ohlo, Illinoia, Utah, northern California). Those south of this line will see the stars on the right (on the map or in the sky) somewhat lower, and those on the left somewhat higher, at the same hour in any case it will be easy to identify them by the

y their relative positions.

Those unfamiliar with the constellations may well begin with the four brightest stars Regulus (at the end of the sickle-shaped group shown on the map), Castor and Pollux (close together), and Procyon late of Wight altersately mores forward and bush-ward with the wardsden of the tides, the greater pays serve of the water at high tide in the Buglish Chan-nel as compared with that in the Scient and Spin-hed canning the Island to be titled upward bothy from the channel pide.

This latest exportments in this direction have been

MAY 14, 1980.

from the channel side.

His laider experiments in this direction have been carried out in connection with the Irish Beas at the mouth of the Breezy. A special type of seismic recorder has been devised and has been set up in an underground position at Histonic Observatory near Liverpool, some two miles from the water's edge. The Apparatus comprises, as it were, a must and a boom, such as is used in the professorie extrustance recorders, the boom being free, so that as the mast moves in such as the contract of the professories of the contract the contract of the contract of the professories or another the boom can also move in such as the contract of the professories or another the boom can also move in such cases of the contract of the professories or another the boom can also move the contract of the professories or another the boom can also move the contract of the professories or another the boom can also move the contract of the professories or another the boom can also move the contract of the professories of the contract of the professories of t A photographic recorder is connected to the appear-tus so as to secure a permanent visual record of the oscillations. The instrument is far more samitive than that amployed for ordinary selemic operations, thereby indicating those very alight movements of the earth which the ordinary appearatus would ignore. The records secured by this instrument conclusively prove that twice every twenty-four hours the opposite sides of the tidal hash are drawn closer together, the

phenomena occurring at high tide when the incr phenomena occurring at high tide when he increased volume and weight of water piled up in the 1-rish Sea and pressing on its bed occuses the latter to asy com-what. The action can be watched, for when the tide is flowing quickly and the tide is high the pendulum moves a considerable distance and keeps pace with the deflection due to the increasing load. At Bidston the weight of the tide of the mouth of the Mersey causes a deflection of about one causes a deflection of about one that he is defined to distance of stream

miles. As the tide ebbs and the weight is reduced the mag dimin ishes like a dent in an India rub ber ball, and the banks on either side slowly recede from one an-other. The extent of this attracting and repelling movement would be more accentuated upon the instrument were the latter ed nearer the sea, and Prot. placed nearer the sea, and Prod. Miline points out that for this reason observatories should not be situated too near tidewater. The regular alternate movements of the apparatus in opposite directions every six hours not only, as it wers, record the extent of the elasticity of the earth's crust, deministration of the classicity of the earth's crust, deministrations of the control of the classicity of the earth's crust, deministrations of the control of onstrating that it is responsive to pulls and strain to a far gre degree than is generally be-lieved, but also weigh the tide it-The result of these exp ments should provide a new field for investigating tidal forces and phenomena, and possibly contrib-

The Current Supplement. Almost the entire issue of the current Supplement, No. is devoted to a complete de 1793 tion of what is known as the New

York Tunnel Extension of the Pennsylvania Railroad, the contliest improvement ever made by a railroad, and one of the most far-reaching importance to industry and to the traveler. Many pictures are published, showing the excavations which were made, the progress of the work, as well as the were made, the progress of the work, as well as the completed station. Dr. Otto Hoffmann writes interactingly on the system of the universe. Carbon transcribedries possesses in comparison with carbon distribution possesses in comparison with a part of the possesses of the carbon distribution of the carbon dist

Recently Mr. W. Canney, of Lends, reed, a paper before the Richerham, Snathewirth Stockey on "Snathemering in the Richer Roses." Mr. Contemp related that there were an indication that the incotory shiftener would be repositanted by monchained dente there were an indication that the incotory shiftener would be repositanted by monchained dente than, as hid cost of qualitativing stream by rest mechanic was contracted out that white solid gages and water in the same product and the production had been plain in, tous, whitein had no manned contraction. At full contribution indicator had, herewise, been invested for this purpose, constituting a gage actuated by the draft of the chinque; and further a gardented some gripter the penale weight of a gage actuated by the draft of the chinque; and further a gardented some gripter the penale weight of the posted weight of the posted weight of the penale weight o

cumeras, arranged in a semicircle. A paper positive is made from each of the negatives and the twentyfour prints are cut out along the outline of the figure, and are then cut in two vertically The forty-eight profiles thus obtained are assembled radially about a profiles thus obtained are assembled radially about a vertical axis in their proper relative positions. By filling in the intervals with a plastic mass a fairly to sketch of the figure is obtained

complete sketch of the figure is obtained. This process may be varied as follows: A mass of clay or modeling was is placed on a revolving circular platform, the circumference of which is divided into twenty four equal parts. The approximate form of the model having been given to the mass by the usual methods, the notifice of the figure in one of the currier; photographs is followed with the tracking point of a pantograph, which is so constructed and point of a pantograph, which is so constructed and arranced that it couying point plows a furrow in a ranced that it is countried to the property of the one division and a second furrow is made from the accord photograph. This process is repeated with each of the twenty four photographs, and the clay between the turrows is carefully removed A very shillful hand is required to perform this operation so as to reproduce every detail of the model, but the

as to reproduce every detail of the model, but the object of this and all other processes of photosculp-ture is to produce, not a finished satus or bust, but a skitch as next parameter a possible The new Cardin process possesses the dwallage of requiring only one photographic camera. Fig 3 illus-trates the neched of making the photographs required for a portrail but. The sitter is possed, facing the ra, before a triple mirror, by means of which the hack and sides of the head are photographed by refe

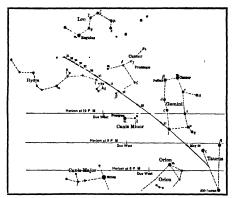

tion As the sitter's face and the three virtual images formed by the mirrors are unequally dis-tant from the lens, the four images formed by the latter are not in sharp focus in the same plane For this reason the ground glass focusing screen is made in four sections, and the plate holder is contrived to hold four plates, side by side, but in slightly different The same cause prod differences in the scales of the four photographs, but in making the enlarged copies which are eming, these differences are easily ved with the aid of the plum mets which are suspended above and at each side of the sitter a bead, and which appear in each photograph and indicate

The modeling apparatus is shown in Fig 1 A vertical post rises from the center of the square iron platform 8 Two photographs, a front view T and are supported in a vertical position by frames which slide in guides bordering two ad jacent sides of the table. These sides are furnished with jointed

supports which carry long rods.

A and B The rods can slide
lengthwise in their supports and
can be inclined and moved vertically and horizontally
by means of the joints of the supports. The rods are used horisontally if the bust is to have the same scale as the photographs, and are inclined for en largements and reductions. The movement of the tograph frames in the guides is limited by fixed paccograph remes in the guides in imitted by fixed stops, so that the frames can be removed and replaced exactly in their former positions The rods and their supports are adjusted to bring

the inner end of the rod A into contact with a con-spicuous point, the tip of the nose, for example, in spicaous point, the tip of the nose, for example, in the full face hehotograph T and the finner end of B into contact with the corresponding point of the profile E. The frames containing the photographs are then removed and the rods A and B are pushed inward in their supports until their inner ends most The point of meeting determines the position of the top of the nose of the bust. The post at the center of the table is covered with clay or other plastic material, which is built out until this point is established in tangible is built out until this point is established in tangible form. The rods are then drawn back, the photographs replaced and a second point of the face is established by a repetition of the process. In this way numerous points distributed over every part of the bunt are stard, each part of adiacent sides of the table, and the corresponding nair of photographs, being employed, as required. The result is an almost complete abretch, obtained from a sitting of a few seconds. All of these operations can be performed by a skilled workman. The hand of the sculptor is called into requisition only to give a few finishing touches in another brief sitting, and to impress as individual artistic actor upon the work.

The Electicity of the Earth,

Some interesting experiments have recently been carried out by Prof Milne, F.R.S., the well-known authority on seismology, to demonstrate the visasticity of the earth especially under the infraeshe of the tidea. Some years ago he showed that valleys during the day are of greater width than at night, there being any are or greater which than at highly takes seeing an expansion or opening out under the action of the sun and a contraction or closing up in the hours of darkness. He also showed by means of seismographic records secured at his observatory at Shide, that the

# Wireless Telegraph Apparatus for Contestants of the Glidden Tour

BY RENÉ HOMER

In the district selected for the annual Glidden tour this year, ordinary telegraph communication will be very difficult, and at times impossible. In 1909, ai-though the thur passed through a comparatively wellintegrates our peace unrough a comparatively well-settled country, the whereach our of contestants were often unknown for hours. One car, for instance, failed to report at the night control, and no one knew what had happened until the next morning On another comming a passenger was injured in an

mboe serial set up in our.

accident, and nothing was known of the matter until it was reported by a belated tourist at the night check ing in Many minor difficulties were responsible for considerable delay that could have been prevented if the cars had been in communication with the last

The Chalmers-Detroit Company propose to keep in The Chalmers-Detroit Company propose to keep in touch with the contestants by means of wireless teleg raphy Complete plans have not been worked out yet, but it seems probable that some such acheme as the use of three field wireless stations will be favored, two of being in touch with the wire system, while the third station is being established at some advantageous point ahead of the contestants. The exact details of the plan

station is being estationate it some avartageous per sheed of the contestants. The senset details of the plan will be furnished after a trial car has had a chance to go over the worst portions of the proposed route In the early part of March successful wireless tol-graph tests were made for the Chalmer-Detroit Com-pany between one of its ears in Central Park, New York, and the old Terminal Building at Park Aven-The distance varied from one and one-half to three miles in the trial from a moving car, while the experiments with the portable field stations showed that this type of apparatus at least would be able to carry on certain communication up to fifty miles, as the field station was able to keep in com-inunication without any trouble with the Metropolitan

and Manhattan Life towers and another wireless station at Newark, N J Later, communication was maintained between a car on the New Jersey highways near Trenton to the "sparkiess" wireless at tion on the Land Title Building at Philadelphia, nearly

hirty miles away
The receiving station for running automobiles comprised a 7 foot serial in connection, through a loose coupling, with a variable and a fixed condenser, a decoupling, with a variable and a fixed condenser, a de-tector of the audion type, tolephone receivers, and a high and low voltage battery. The sending set com-prised two storage cells, a 10-thon peark coil, two Loyden Jars, and a 3½-inch "radiotone discharger" stellar to those used at the Metropolitan and Men-hatian Life mailtons. This apparatus, which worked successfully up to three miles, the farthest distance successfully up to three miles, the farthest distance tried, would-probably operate for several miles far ther. The ground was gooured by drawing between the rear wheels a bleyfer tubing frame supported on four small wheels mounted on roller bearings the middle space being occupied by three Sinch steel wheels with the bearings arranged no as to allow the steel of the bearings arranged no as to allow the steel of the bearings arranged on a to allow the steel of the bearings arranged on a to allow the steel of the bearings are steel of the steel wheels all times with her read on the meadamized roads of the park this system of grounding worked fairly well, although on the sandy roads of Now Jursey, of the park can system or grounding worked tarry well, although on the sandy roads of New Jursey, where the subsequent tests were made, a great deal of difficulty was experienced in properly maintaining the ground The spraying of water over the contact wheels by means of a small rubber tube leading up into the car partially overcame this trouble, and no doubt subsequent experiments will provide a suitable way of securing a satisfactory ground contact, al-though it is true that probably for some time to come the speed of moving cars must be considerably limited for successful wireless work. The cars in the tests ran only about ten miles an hour

Field stations which can be put up in five minutes can be operated more successfully and the same apparatus used in the automobile by stopping the mathine and securing proper ground has a range of about ten miles. The sending circuit of the field stations used in the longer distance tests was the same as that of the moving stations with the exception that three storage cells instead of two were used, and another 10-inch spark coil was connected in parallel with the first coil, so as to be operated from the same key

This gave a range of about fifty miles

The field sending station was provided with a 100foot serial secured at one end to a sureader attached to a 4x-foot bamboo telescope mast and leading down diagonally to the top of a 12-foot mast about 90 feet away and thence back to the wireless apparatus about midway between the two poles.

Two of the photographs show the first successful test, in which a 35-foot aerial and a 6-inch spark coll actuated by one storage cell were used. With this apparatus, from Central Park, communication could be held with the laboratory at 42nd Street, about one

and one-half to two miles away.

In the more recent tests additional condensers storage cells, and audion receiving accessories were used The closer view shows a radion detector in use (top of the box to left) while a perikon detector is shown unconnected on the table in front of the other appara tus The box upon which the operator is sitting contains the interrupter, spark coil, and discharger, which are inclosed on account of their delicate nature and because they have not yet been protected by patent in the newer station all this apparatus is carried in the automobile, and there is no necessity for setting up the apparatus on the ground although the seap box does indeed make an admirable table for a wireless station
In the coming tour it is proposed to send two scout

Automobile wireless equipm

rs ahead of the regular contestants, each one of which will carry the complete field set of even greater range than that which every car can carry Points where the telegraphic facilities are poor or impossible where the telegraphic facilities are poor or impossible will be picked out and the two cars will arrange to be at stations at these points just sheed of the pilot car one station being eqtipped for business while the other is taking care of the telegraphic business of the tour in this way one of the two field stations will be in operation all the time, while the other is being set up at the next point along the route

Disastrous as the floods in France have proved for the railways, a worse disaster occurred one day last winter in America. Three days previously a warm wind arose in the State of Nevada, so suddenly as to melt all the snow. The result was such a torrent as to entirely wash away 100 miles of the San Pedro, Los Angeles and Salt Lake line south of Caliente The route of this line was known to be rather liable to this, but was chosen as it saved much distance Soon after its construction it was undermined by a storm, which did over \$500 000 damage to it. The engineers Are now engaged in surveying the district in order to find a safer if longer and most costly route. Which ever route be chosen, it will be from six months to year before the line can be built and the cost will it is said, be from ten to fifteen million dollars

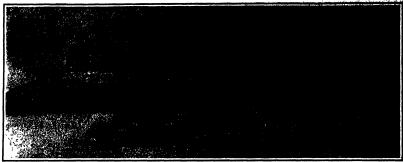

The sectomobile confraent with the abrust and wireless apparatus.

o- sung wireless messages from an automobile.

The practical success achieved with the gasoline-propelled motor sieigns on the Shakiteton and Charleston and C mounted on runbers or skates, a chain and spreecht with apuda with a prized with a prized with the ripped the snow and fee being flitted at the position occupied by the wheels in the ordinary motor car In the new sleigh, however, what may be termed an adaptation of the pedrall or cater pillar ayatem has been resorted to, which imparts a gratter dozree of efficiency to the vehicle, and enables

it to surmount obstacles and to travel over rough los and snow with case. In view of the conditions prevailing and the work it is intended to fulfill in the south polar regions, the segime is of a special type developed the prevailing and the prevailing and the prevailing and the prevailing and covering the whole because the prevailing the prevailin

# THE FLIGHT FROM LONDON TO MANCHESTER

## THE AVIATORS' OWN ACCOUNTS

Both White and Paulhan have furnished the London flatty Mail with accounts of their remarkable flights. White rose at 1.30 A. M. Twonty-four minutes later he was in the air. It was so dark that poople were

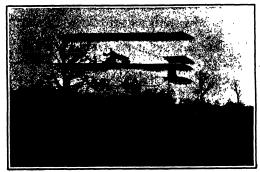

waspe rose as Lao. A "reculty-root runnisses must be was in the sir I twas so dark that people were grouing about with instarts.

As I stood by the side of my serropians," White states, where was atter backness facing me, faintly states, where was atter backness facing me, faintly states, there was not record to Rosels station, and the states of the state of the stat and I rose once more.

"Great difficulty presented itself in knowing in the darkness whether I was ascending or not. I had done no night flying before, but I soon became accustomed to watching closely the movements of my elevating plane, which was silhouetted before me against the

ered on for a spell with nothing at all to guide me After leaving the lights of Roade bohind, the gleam from an occasional signal box far below helped me, however, and so I picked my way through the night to Blisworth

"Here I felt surer of my ground and here away to

Grahame White leaving Rugby.

flow off till I was over the train. I saw the lights of Rugby, flow over the town, and forged shead "Daylight began to come now, and from here on to the point of my descent in a field near Polesworth my etruevie was not with the darkness but with the wind

Paulian, too, seems to have been troubled by the winds, for he bears out White's account. He writes

"I had to fight the wind all the way from London.

Not a moment s rest came to me in my battle against

"Glance at my altitude chart and you will see that I made rises and dips of as much as 720 feet always with the object of flying in the steadlest level of air f could find
"After the start I was going north for a long time

before I sighted the special train which was accom-panying me, but there was no mistaking it when it caught me up, with three loud toots of the whistle and a big white signal cloth flowing from the window

"It looked like a handkerchief from such a height but it told me all. I could see that things were going well. The wind whistled and so did I

well The wind whistled and so did I
"I flew until it was quite dark Ali I could make
out beneath me was the smoke of the train once in
a while and the occasional flicker of lights from a

"I came down rapidly from 300 meters to 100, so that I could be more certain of my direction. Then came the most exciting moment of my flight. Darkness had fallen and before me I saw the lights of Lichfield I decided to alight in some convenient meadow before reaching the town and to de this I sank down to 180 feet. I was immediately above what looked like a largo factory with a chimney I am now told it was a brewery And so, to slight safely in a field with no damage done, I made a fishbook turn, and my machinu

was now pointing toward London
"Suddenly my motor storned Every drop of petrol had been exhausted and the machine swooped down ward almost like a stone dropping

"What should I do? Beneath me was the browner

White's scroplane after landing.

the left for Weedon Faint lights shown here and it was the fierce gusts which eventually brought not there Some, no doubt, were cottage wiedows and others, I think, were the beed lights of motor-cars. I Paulhan, too, seems to have been troubled by the of over Weedon, my eyes becoming more accus-

tomed to the darkness.

"On I flew The welrdness of the sensation can scarcely be described I was alone in the darkness.

scarcely be described I was alone in the darkness with the rear of my engine in my sers. As I glanced back small bright flashes of light, the discharge of the exhaust gaser from the motor, fashed out in the nickness of the many one, for a spall. I scarced soft the right, I when me, for a spall I scarced soft the right, I when a light tomy jet caught my eye, and I worked my way back to the rullway line again
"At a little inm by the readside near the village of Crick a friend had promised to draw up his motor car, schaing its headilights upon the wall to set as a gride chain in the conditions.

Creax a rreson may remnase to creaw up memore car, shising its headlights upon the wall to act as a guide for me I was keenly on the lookest for this unmis-takable light sign, and, sure enough, I saw it quite distinctly below me soon after I left Welton station

penna.

I deviated a little from my course and headed for this patch, of light. I saw the motor car moving as I. approached, with its headlights throwing a great path of light down the readway. It set off at a break-neck pace, its driver evidently meaning to guide me

neck pass, its driver orificatly assuming to guide me on any vay.

"Leaving the miliway lise on my left, I followed the light of the motor cay, and for a mile or no I hierarch almost dipartly above it, attening it to sate the my pilot. But while I was doing an I chanced to giftene over to the left again. Coming down the yath-ity line I replayed a poofs trait. It was making he will like I replayed a poofs trait. It was making he

"This, I thought, will be a splendid guide, and so I swung away from the lights of the moter car and

Rectarging the gaseline tank of White's machine. THE PLICAT PROM LANDON TO MANGRESTER.

and a certain smash, behind me was a narrow field, which was almost like a spider's web with its mesh of telegraph wires

"I had an imperceptible fraction of a second in which to make up my mind, and I decided to risk the telegraph wires. As I sank I made a sharp twist

the telegraph wires As I sank I made a sharp twat right back on the line of my rourse, and was lucky enough to lift myself over the wires 'I went to hed at 1 o'clock deiding to start again as soon as I was light or o'clock allittle earlier I slept like a top for five hours

"It was still dark when I reached the narrow readow beside the Trent Valley station in which my machine was lying. My mechanics had worked well during the night. The machine was charged with petrol and she was all ready for the start.

Happily, favored with the headwind I was then I rose without difficulty, turned, and headed straight

Tiere was the end of my concern about the issue of the race. Barring accidents, I was bound now to react Manchester in safety and in good time, and there was no reason to anticipate accident, for I had surn the worst of the difficulties—that of a rise from a narrow field only 120 yards long above dim lanterns which were my only indications as to the whereabouts of the bedge.
"As soon as I got up I made a circle followed the

railway, and then set off for Crewe, fighting all the way against gusts of wind So certain did I feel of the road that I did not trouble to take my man on the

## COMPLETION OF THE PERMSTLVANIA RATIDOAD TURNELS AND TERMINAL STATION.

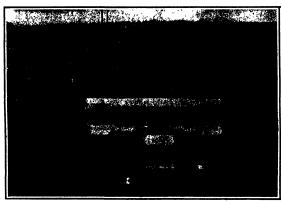

As late as the year 1901 the Pennsylvania Railro was employing ferries to land its passengers in New was employing ferries to land its passengers in New York city just as it did in 1871, when it first leased the United Railroads of New Jersey Ten pears ago the system was hauling freight to Esstern cities over practically the same heavy grades as were to be en-countered in 1876 To-day the company is completing a monumental improvement in and around New York city which will enable passengers to travel from east ern, western and Long Island points direct into Manhattan Island, arriving at a railroad station which, for convenience and for the beauty and dignity of its architectural appearance, probably outranks any simi-

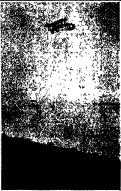

lar building in existence.

During the past ten years the company has spent an enormous sum of money in straightening out its line to the East, and in cutting down grades, and in a few months' time freight trains which are already traveling over the new lines, on which they encour ter no grades greater than twelve feet to the mile, will be run direct to large terminal wharves on the New Jersey shore of upper New York Bay, and fer

the original street surface, extend from Tenta Aramab to Servantt Avenue, From Tenth to Nitet Aramab to Servantt Avenue, From Tenth to Nitet Aramab to Servant Avenue, From Tenth to Nitet Avenue and Tenth and Tenth Avenue the bage street and Tenth and Thirty-blard Street. The excertation covers therefore over five of the largest city blocks, and travolved the removal of over \$200,000 colleb parks of material. Proceeding seaterly from the terminal year, the tracks, four in number, are carried below Thirty-second and Thirty-third Streets to the East Niver, which we have the past in the past of the past

cent.
The new terminal station located between Thirty-first and Thirty third Streets, and Seventh and Bighth Avenues, is a truly magnificent structure, built of grantice on classical lines The terminal work was carteen or classical lines. its on classical lines The terminal work was ear-ried out under Mr. George Oibbe as olhel engineer, to whom we are indebted for contrained curing the prep-aration of the present article The main entrance to the station, on Seventh Avenue, leads through an ar-cade forty-free feet wide by two bundred and trensty-five feet leng, to the main waiting room, which, with its width of 105 feet, ranks as the largest in the world-just what these dimensions means is shown by our front page engraving, which portrays the central por-tion of the New York City Hall with its tower, standing on the floor of the waiting room, with the top of its flag pole falling to reach the roof by fully ten feet.

The crowd on Wormwood Norubbs awaiting White's start.

Paulhan in full flight.

second stage of the journey This was a mistake, for after leaving Crowe I thought the first station marked my landing place, but I could discover none of the marks I expected to find there, and I had to circle back my landing place, but a boots and i had to circle back toward London before I picked up the whitewashed marks on sleepers which directed me onward "I made yet another mistake in my route, and had to curve in yet another circle backward, but at last I ocurve in yet another circle backward, but at last I ocurve in yet another circle backward, but at last I ocurve in yet another circle backward, but at last I ocurve in yet another circle backward, but at last I ocurve in yet another circle backward, but at last I ocurve in yet another circle backward, but at last I ocurve in yet another circle backward, but at last I ocurve in yet another circle backward, but at last I ocurve in yet of the property of the proper

of land It contains 73 miles of track, and has a caof land It contains 73 miles of track, and has a ca-pacity of 1,850 cars. From the Sunnyaide yard there are tracks leading to the New York connecting rail-road, which will form a junction with the New Haven Railroad at Fort Morris.

An important feature of the New York to An important reature of the New York tunnel e tension is its relation to the Long Island Railros which is subsidiary to the Pennsylvania system. It estimated that forty minutes will be saved between It is Long Island points and New York city by the or tion of trains through the East River tunne Pennsylvania station at Thirty-third Street,

ction of the tubes beneath the Hudson The construction of the tubes beneath the Hudson and the East rivers has been so fully described in previous issues that it will be sufficient here merely to recapitulate the principal features of this work. The tubes under the Hudson River were driven by a The tubes under the Hudson River were driven by a special shield designed by Charles M Jacobs, who is also well known as the chief engineer of the four Hudson River tubes which were simultaneously being driven for the Hudson Company's system of rapid transit tunnels. Contract for the North River tuntransit tunnels. Contract for the North River tun-nels was let to the O'Rourke Engineering and Con-struction Company The shields were thrust forward by twenty four rams capable of exerting a pressure of 3,400 tons. At first, the silt and other material were removed through the doors in the front of the shield, latterly, however, the shields were pushed bodily through the material, and only about o a-third of it was removed through the tunnel, being admitted of it was removed through the tunnel, being admitted through the doors in its lower face. The cast-rice linits of the through the doors in its lower face its circle in the control of the neaver lining, wen concreted up and equipped, is 31,469 pounds per lineal foot. The weight of the slit displaced, per linear foot of tunnel, is 41,548 pounds The weight of the tunnel with the maximum train load is 41,869 pounds per linear foot Thanks to the very able and officient engineering staff, the excellence of the contractors' equipment, and

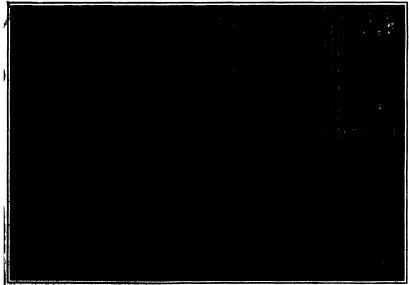

the harmony with which all concerned entered into the task of driving these tunnels, the work was carried through practically without a hitch, and considerably faster than the most sanguine expectations

The driving of the tunnels beneath the East River, rae driving of the tunnels beneath the East River, which was in obarge of Alfred Noble, Past President of the American Society of Civil Engineer, was done to the American Society of Civil Engineer, was done material through which the these pased, much trouble americal through which the these pased, much trouble americal through which the through so successful completion. In addition to the many millions the Pennsylvania Railroad is appending on the foor tunnels under the

Railroad is spending on the four tunnels under the East River, and the station and terminal in Manhat-tan, all of which will greatly benefit Long Island, the Long Island Railroad is increasing its own facilities in all directions, so as to adequately care for the larger traffic which will result from the completion of the tunnels. The contemplated works will necessi-tate an expenditure on the Long Island system of more than thirty million dollars The new service vill include a six track line from the mouth of the tunels to Woodside 2½ miles, one mile of 8-track road, Woodside to Winfield, two miles of 6-track road, Winfield to Glendale cut-off, and 4½ miles of 4-track winded to General cut-on, and 4% miles of 4-frack road thence to Janaica. Trains will run from Thirty-third Street, Manhattan, to Janaica in 18 minutes, to Garden City in 34 minutes, to Mineola in 34 minutes; to Far Rockaway in 33 minutes, to Flushing in 16 minutes, and to Great Nock in 28 minutes.

minutes, and to Great Nock in 28 minutes.

We will close by giving some of the startling statistics of population which in the judgment of the Pennsylvania Railroad Company fully warranted the enormous outlay involved in the great works which the company has undertaken The population in the company has undertaken. The population in-cluded within a circle of nineteen miles drawn from the City Hall in Manhatian as a center, was in 1890 3,328,988, in 1900 it had increased to 4,612 153 and in 1905 it had grown to 5 404,633 It is estimated that 1905 th had grown to 5 404,538 It is estimated that by 1913 the population of this territory will be about 5,000,000 people, and in 1920, 5,000,000 The rail-mode that have their termind on the western bank of the Hudson River carried nearly 18,000,000 people in 1886 In 1895 they carried over 1200,000, in 1895 more than 94,000,000, and in 1906 they carried about 14,000,000 people The significance of these figures was fully considered by the Pennsylvania Rail-mode, and the significance of the figures was fully considered by the Pennsylvania Rail-mode, and the significance of the significance of the pennsylvania Rail-mode, and the significance of the significan

## HOW TO BUILD A HOUSEBOAT FOR \$800.

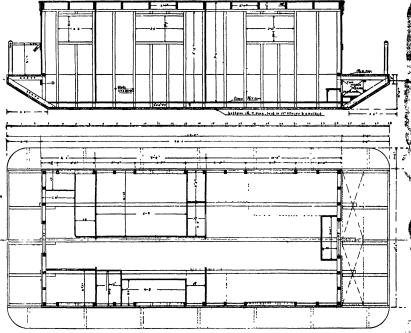

The proposition of spending a summer affect is one which appeals to many persons fond of the water, but her coal of a yatch large enough to accommodate confortably a family for a protracted period is problic to the majority, therefore people swelter ashore in but and unremfortable incide, and snatch such approprient from the water as chance and circumstances

during the summer meanon under equality constructed conditions. The cost of the host would vary, according to whether it was built by sansateurs and how shabornistly it was constructed and fitted up A moderate price shipbuilder should build this host complete with totled and water tasks for twe hundred dollars. As the host is very simple in construction annateurs should be able to build it for about three hundred dollars. At a summer to be a summer to the shabes of the same land and the same that the same to be supported to lead to be suffered to the same to the same land to the same to the same to the same land to the same to the same to the same land to the same to the same to the same land to the same to the same to the same land to the same to the same to the same land to the same to the same to the same land to the same to the same to the same same to the same to the same to the same same to the same to the same to the same same to the same to the same to the same same to the same to the same to the same same to the same to the same to the same to the same same to the same to the same to the same to the same same to the same to the same to the same to the same same to the same to the same to the same to the same same to the same to the same to the same to the same same to the same to the same to the same to the same same to the same to the same to the same to the same same to the same to the same to the same to the same same to the same same to the same

For those interested in building such a boat themselves the following hints on construction may prove

The first step in construction is to prepare the pround and belief the sides and bottom of the buil. The ground about the prepared by driving posts and using stringers and blocks so pinced that the built may rest during construction on an absolutely lavel plane. By doing this a level and plumb like can be used to get the house and its compartments built plumb and true After the building foundation is prepared, start by so that they touck on the minds and anti-open along, it is notated. This is to allow the existing to be driven in and to prevent it being peahed clear through to the inside. In perticag the hull together the large parameter in Doc Halls about, of c 4th inches less. The corner lot. A should be fastened to the sides with a perturbation of the board of the control of

It might be well first to call attention to the two water tanks that are shown in the drawing. If these are to be put in it is well to do it now, otherwise some

SECTIONAL PLAY AND SIDE VIEWS SHOWING CONSTRUCTIONAL DETAILS OF THE MODERNOAT.

A solution of the problem of living cheeply and comfortably fields it found in the houseboat Back a life offers many charms and advantages it is generally cooler on the water, and the aris afresher and better being free from dust and land amelia. Bailting a slavay "on Lop," and the outertainment of friends is againspatied with more charm and privacy that is a reflect assume hotel if the locality becomes tireform the house-beat can be towed to another harbor for the contract of the contract of the contract of the first the contract of the contract of the contract of the first the contract of the contract of the contract of the contract of the first the contract of the contract

TWO DOVEL MOTOR SERVE

"Yes novat serves said."
"Quescioled from page and to stand the ground, appears to stand still, while he select attender over it. This is the motion that actually takes pince for the top of the chain travia forward at rwice the speed of the select. It will thus be seen that in reality the lower part of the chain in contact with the

part of the chain in contact with the ground constitutes as unrace over which the vehicle itself can move. The driver has his position on a box behind the engine, which seat forms a receptacle for tools, spare parts and other accessories. That the vehicle has great climbing power has been conclusively proved, for it will ascend steep banks of earth and ride over serious obstacles castion in speed

Although this sleigh can carry a party and full equipment, its actual func-tion is to act as a tractor for the haulage of ordinary sledges, the trailing ve bicles carrying the loads. Upon comple tion by the builders, the tractor was taken to Norway by Capt, Scott, and sub-mitted to some exacting trials on snow covered Lake Fefor and the tumbled country in its vicinity, where the condi country in its vicinity, where the condi-tions were somewhat analogous to those prevailing around the south pole. Heav-ity laden trailing sledges were hitched on to the dractor and numerous journeys were made among the Norwegian ice fields. The vehicle proved itself fully capable of withstanding rough usage, and Capt. Scott expressed his complete satis-faction with the results achieved

Very different from this sled in design very suzerent from this sied in design is one which has lately been put to a series of severs running tests over all kinds of ice and snow in the district of the Silian lake, Sweden The accompanying photograph of the motor sieigh was taken in the Easter days of this year, after the above-mentioned tests had

been carried out.

The design differs from that of other automobile sleighs in the driving mechanism. The sleigh is propelled by two driving wheels, each fitted with a number of steel paddles between which an elastic frame is fixed. This simple construction thus combines the advantages of a paddle wheel and the Canadian snow shoe, having the propelling capacity of the former on fixed ice and snow sur-faces, and the supporting and friction capacities of the latter on loose snow The flexibility of the frame tends further to prevent the snow from clogging by ex-pelling it from the paddles. The driving wheels run in the tracks made by the wheels run in the tracks made by the sleigh runners, and thus tend to make a good contact surface for the paddle wheels. In case the snow is not com pressed enough by the runners, the paddle wheels sink by their own weight into the snow, and compress it sufficiently by means of the frame The paddles engage compact snow by cutting with the compact snow by curring through the crust as knives, and work on account of their breadth, against such a large wedge of the frozen snow surface, that an effective counter pres e is obtained which would otherwise sure is obtained which would otherwise be impossible if the driving wheels were, for instance, provided with splices instead of paddles. The sleigh is in this in-stance driven by a chorse-power double-cylinder air-cooled gaseline motor. The motor steigh illustrated is designed to serve only as a traction engine, to which any kind of sleigh can easily be attached or detached within a few minutes.

or unsecuted writin a new mindless.
It is no course easy to make the motor sleigh as self-contained as an ordinary automobile, and the electrically-driven foreignment of this sleigh were successfully built in this way.

The motor sleigh is governed by means of a very ingenious and reliable steering devices over for remote hand operation The power required for steering is truns

ngibed from the operating hand-wheel through facible tred tubes to the motor furth the text a speed of 4 miles as a hour cyst a simoth ice purious was attained. When traveling over the snow and feeduraged rands, which were in a very lad

An Industrial Laboratory for the Im-provement of the Incandescent Lamp.

Although the establishment of a rearch laboratory by a large manufac ing organization is not a novelty, the in-ception by such an organization of a lab-oratory which has for its object the development of science rather than the improvement of some industrial commod ity is probably without precedent. For that reason, Mr E. P Hyde calls atten tion in a recent number of Science to the new physical laboratory of the National Electric Lamp Association, even though it is still only in a formative state. The it is still only in a formative state. The object of this laboratory is scientific, the specific purpose being the development of those branches of science with which the art of lighting is closely associated The fundamental idea which has prevailed in the organization of the work is the proper co-ordination of physics and physiology. ration of the the physiologist and perhaps the psychol

ogist.
The organization of the laboratory is proceeding with this idea as the foun-tion. The development contemplates sharp distinctions among the different divisions of the work. The prob be investigated, however, group ne investigated, however, group themselves roughly into three classes. therefore require, in order to insure proper attention to each, a threefold divi-sion in the organization. The three groups of problems to be investigated may be classified as (1) those that have may be classified as (1) those that have to do with the production of luminous energy, (2) those that have to do with the utilization of luminous energy, and (3) those that have to do with the effects of luminous and attendant radiation.

Under the first class will come the in "existing the laws of redistion, and

vestigation of the laws of radiation, and of the radiating properties of matter. The problems in this class are purely physical and the corresponding division will be intrusted to a competent physicist.

Under the third class will come the in vestigation of the effects of light and the attendant radiations on the eye, on the skin and on microscopic organisms. The problems in this class are physiological, and the corresponding division is under the charge of a trained experimenta physiologist

of problems (the first and the third) which are distinctly different, there is another (the second) which forms the onnecting link. Touching on one side connecting link. Touching on one side the physical production of light, and on the other the physiological effects of light, this intermediate division of the work will embrace most of the scientific problems peculiar to illuminating engi pronouns peculiar to intumnating engineering. Investigations of the aborbing, reflecting and diffusing properties of matter, the measurement of light, i e, photometry, and the study of the complex phenomena of color and color sensation. properly come within the scope of this department of the work.

Section Cities Washing,
Mesers, Allice and Gimel recently presected a paper to the Academic des Sciences concerning the good results ob-tained in the production of cleder by wash ing the apples with an oridizing solution in the apples with an oridizing solution of the populations of the north and west of Frame, its manufactures should concern hygienize as well as technicians. In many cases the quality of the product is much cases the quality of the product is much inferior to what it should be were the process well carried out. The washing of process well carried out. Ine washing on the applies indispensable to free them from the impurities which they carry, but we must also take account of the defective quality of the water which is available in many cases. The authors' previous re(Concinded on page 466)

# THIS VANADIUM STEEL GEAR BLANK

is 5% inches in diameter and was bent cold—flat upon itself as shown, without a sign of a crack or fracture.

um is an elementary metal i it melts at 3600 degrees h ; alloyed with iron in the pro-portion of one to two, it melts before the fusing temperature of iron or steel, and as Ferro-van-adium may be thus added to the foundry ladle, the open hearth furnace or the crucible, to iron or steel

When so added it comb nitrogen and removes these gases in a fusible dag, making the remaining metal dense, nonous, homogeneous and stronger to a marked

Its action is consistent becau creases the tensile strength and elastic limit of steel, it maintains the ductility, as may be seen

A pocket knife with a Vanadium steel blade will cut chips from a steel spike. A carpenter's saw of Vanadium steel will cut through a two-inch gas pipe unharmed. Locomotive cylinders of Vanadium cast iron wear five times as long as ordinary iron without reboring. Forgings from Vanadium steel ingots are the strongest, most elastic and longest lived forgings possible Vanadium steel springs, owing to their freedom from crystallization, wear three times as long as carbon steel springs.

You are getting only partial results if you don't use Vanadium steel. Its marked wearing qualities commend it as the only material for railroad switch points and crossings, high-duty parts of all machinery, springs, gears, axis, and all forgings.

AMERICAN VANADIUM COMPANY 331 FRICK BUILDING PITTSBURGH, PA.

(Concluded from page 477)—
searches showed them that oxidising agents could be used to advantage, and they experimented with hydroxyl, oxonised water, and hypochlorites of soda and of lime is solution in the water which is used for the wanting Used in the proportion of 40 to 50 centiferammes per little. of water (04 to 06 per 1,000), which is more than enough to destroy pathogenic germs of the human species, they find that hypothlorite of lime has a good influence the activity of the pectase, which is the congulating diastase of the pectic matters of the juice of apples. Where the fruits congulating disatase of the pectic matters of the jutic of apples. Where the fruits carry much impurity they should first be washed in ordinary water before immersing them in the ordinaring solution. The tests carried out first in the isborstory in 1900 were pursued in the cider-making districts during the seasons or 19074 and 19084, and they led to the following conns First, the addition of hypoclusions First, the addition of appennication of the of lime in the above proportions according to the state of purity of the fruit, assure the purifying of the doubtful waters as to bacteria for the present purpose. The juice of the fruit thus treated is found to clarify rapidly. The congulation of the to clarify rapidly The congulation of the pectlo matter is always well carried out and we have formed an abundant brown surface layer This assures the stability surface layer This assures the stability of the cider with time in this respect. The dissusses, especially the maloxydase, are eliminated by precipitation, so that we avoid the principal cause of darkening of the cider it is also found that the hypochlorite has a favorable selective action on the Saccharomyces mail and a destructive action on the anserobic germs, and it thus solves practically and simply the problem of a pure fermentation. By ad-ding to this treatment the method of repeated under-drawings, we can obtain cider which will keep much longer, and this is of interest for producing bottled this is of interest for producing bottom cider There is no harmful matter intro-duced by the present process. Compara-tive analysis of cider made from treated and from untrated apples shows a marked advantage in favor of the former.

Military Kites.

Kites, as well as dirigibles, captive balloons, and acroplanes, may be made serviceable in military scouting, and their simplicity makes them especially valuable. Furthermore, they can be employed with any velocity of wind between ployed with any velocity of wind netween is and 66 feet per second, whereas the use of a captive balloon becomes difficult if the velocity of the wind exceeds 18 feet per second Experiments recently made at Boulogne by Capt. Saconney show that it is quite practicable to carry show that it is quite practicable to carry two persons by means of a large kite. The kites used in his experiments were of the Cody type with four sustaining planes and with triangular stabilising wings in this method of construction wings in this method of construction each rectangular cell is strengthened by diagonal rods of bamboo to which the stabilizing wings are attached. The ap-paratus consisted of a series of kites conpartitis constitute of a sorted of street of sup-porting the cable, and of a second series of kites attached to a very light carriage, which moved along the cable, and from

which moved along the cable, and from which the car or basket was suspended Kites can nearly always be used at sea and on the coast. They are simpler and less expensive in every way than balloons and they are also strong and easily repaired. These qualities should make them valuable for many purposes in military and especially in naval opera-

A wireless telegraphy station near Beriin claims to have established a record d overland and sea transmis sion of wireless messages. The station recently succeeded in maintaining wire-less communication with a Woermann less communication with a Woermann liner during the entire voyage from Hamburg to the Cameroon The greatest distance signaled was 8,600 kilometers (over 4,000 miles) Although messages had to pass over the Alps the Algerian tableland, and the Adamana Range, communication was, it is stated, effected with astoniching cases.

## THE BUSINESS MAN'S TRAINS

The man of affairs when he travels wants all the conveniences of his club. He will either carry his business on veniences of his club. He will either carry his business on the train with him, or make his trip a recreation. In either case the Limited trains of the Pennsylvania Railroad meet his requirements. If he wishes to talk business en route, a drawing-room or state-room supplies the private office. If he wishes to finish up some left-over correspondence, there is a stenographer at his elbow to do his bidding without charge. If he wishes to keep in touch with the market, he has the stock reports, which are telegraphed to the train. Many business and professional men take advantage of these faithers. facilities.

If, on the other hand, he wishes to forget business and take a mental rest, he can do it in a luxurious manner, and take a mental rest, he can not it in a introduction manner was unrounded by tasteful appointments and all the things that his club supplies for satisfying the inner man. There are books to browse at, periodicals to skim over, and beyond the wide plate windows an ever-changing picture of nature in all manner of environment. This is restful and at the same

all manner of environment. This is restful and at the same time engaging. The quintette of Limiteds, led by the "Pennsylvania Special" (the 18-hour train between New York and Chicago), "The 24-Hour St. Louis" (fast evening train to the Southwest), the famous old "Pennsylvania Lamited" (the Pioneer of the Limited's to Chicago), the "Chicago Limited" (evening train to Chicago), and the "St. Louis Lamited" (the afternoon train to the Southwest), are all expressly equipped for the use of the business man and the traveler for pleasure

NEW YORK

LONG ISLAND

- ERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.
- fficiency and safety in electrical installations depend chiefly on insulation. KERITE is more dependable and will outlive any rubber and mineral insulation made.
- esults have demonstrated the superiority of KERITE. The only real test is the test of time. KERITE wires and cables installed half a century ago are in service today.
- I nitial tests determine the properties of an insulation only at the time they are made.
- They do not determine how well it will do its work years afterward.
- The rubber (a perishable substance) is the basis and limitation of all other insulations.

  Kente (an imperishable material) is the basis and gives practically unlimited life to KERITE insulation (the rubber being incidental).
- xperience of others should be useful to you. Long life and efficiency and not first costs mean ultimate economy. Insure your service by using KERITE.

### HEW SKYSCRAPERS FOR OLD

NDER modern industrial conditions things are done in a big way and often with a strong dash of the spectacular. But the city dweller, albeit he is daily confronted unusual and the unexpected must confess to some measure of surprise on learning that a modern akyseraper 300 feet in height, and but a dozen years old is to be torn down to make way for a new structure which is to be several stories higher, and—more up to date. If you please fo the conservative Euro-pean, the ruthless demolition of a building that must have cost over a million dollars and is still entitled to be called new, will appear, no doubt as another instance of our national vice of extravagance. But it is not so. The Gillender building is being razed in dance with a certain industrial doctrine, which has been found to give most excellent economical rehas been found to give most excilent economical re-sults namely the dotrine of the scrap heap, ac-cording to which we blive and have proven in a thousand ways that so soon as the marn to improve-ment or divelopment renders it certain that there is more profit in scrapping an esticing machine plant, or building, and replacing it by another more efficient or diversity respects. It is a matter of sound business. or of greater capacity it is a matter of sound business to send that machine to the junk heap wrecking gang' loose upon that building turn the

The policy is purely utilitarian—brutally so if you like—a mere question of dollars and cents, but it is a good business policy nevertheless, and, in reality en one of the most powerful factors in bringing about the present phenomenal industrial development of the United States

Your old world engineer or architect with perhaps tronger flavor of sentimentalism, hesitates a faithful servant so remora lessly out of the way a patinii servant so renors wessy out of the way lie will point a the pride to his forly served documentive with its million mile record of service, and he will add wing to wing and another story or two to a building, if this be possible rather than rare to the foundations and build from the ground up It is a case of each to his choice, though there are not want ing many indications that British engineers are begin ning to realize the value of the scrap heap, and apply the principles which it implies in the development of their industrial enterprises

The Gillender building which stands at the north west corner of Nassau and Wall streets, in this city west corper of Vassau and Wall streets, in this city be a sixten-story sie-eltranic office-building which was completed in 1886. The construction was first class, the foundation being put down by the pneu matic process and the siev! frum thoroughly braced to resist wind and racking strains from street to feet and the picturesque three-story tower above brings the total height to about 300 feet. The exterior of the building is faced successively with gran limestone and terra cotta Examination shown the structure to be in as good condition to-day as when it was put up and engineers and architects will be greatly interested as the steel frame is uncovwill be greatly introcuted as the acted traine is unto-erred to observe how much, if any exidation of the inclosed steel work has taken place. In all probability judging from the condition of the steel work of other composite buildings which have been demolished. south for instance on the Pobst building removed a such for instance as the Point Parish the Control of the New York Times at racture no reading will have occurred that is worthy of mention The runwal of the Olliender building while it will not probably bring to light any nea facts regarding the bactor of inclosed sievel columns, will attunct establish the conviction (about ewrything be found intact) that if the steel work be

thoroughly painted at the mill, at the shops, and before it is inclosed in the building, it is absolutely proof

as long as the inclosing walls and roof endure Outside of rusting, there is no other known agency that tends to shorten the life of the steel frame of th modern akyacraper Exploded long ago was the theory of the fatigue of metal Simple statical stresses or even dynamical stresses of frequent repestreams or even dynamical streams of frequent repo-tition do not necessarily shorten the life of stee structures it is only when these repeated streams approach the clastic limit that the strength of the noted by invertible-and in the modern skysersner no such conditions exist Certain imaginative magazine writers to the contrary notwithstanding the visitor to New York five hundred or a thousand years hence will find the skyscrapers of to-day in perfect condition, provided, of course, that the doctrine of the scrap heap above referred to has not called for their

### OUR WAVY AS A WATIOWAL INSURANCE.

T the recent launch of the "Florida," as the great ship was starting down the ways of the crowd was heard to remark "! a shameful waste of public moneys it seems when we think that this \$10,000 000 ship may never be employed in the work for which she was built, and that if she ever gets into a fight, she may be sent to the bottom within a few minutes of the open ing of an action. The remark was characteristic of much that is being said and written on the subject of the wastefulness of modern armaments Taken by itself it would seem to be convincing, but if we look first! It would seem to be convincing, but if we look at the question breadty, and with that just sense of proportion which is necessary to a correct estimate of the value and meaning of things we shall see that such a talk is the justest sophistry. The centifices of a battleship must be judged in relation to what it stands for and the work which it is intended to do in the last analysis the "Brofied" is one element in an conomical system of national insurance, designed to protect both the lives and the property of the ninety millions of inhabitants of the United States

The true test of the question of the extraof naval expenditures is to determine the ratio that of mail expenditures is to determine the ratio that they bar to the money value of the property which they protect. The following estimates of expenditures, which have been furnished from Washington show that the first cost of the ships of the navy, as they float to day is roughly \$400,000 000, while the current annual expense of their maintenance is about \$44,000, The cost of maintenance last year, including pay of officers and entisted men of the navy and marin corps pilot dues provisions, clothing, ordnauce equipment, medical and machinery stores including coul, water and other incidentals amounted to nearly \$32,000,000. The cost of repairs to the bulls machin ery and equipage of the vessels amounted to more than \$6,000,000 making the combined expense of pre-serving peace on on shores nearly \$44,000,000

The amount involved covers the expenses of all the various types of our ships of war which include bat tieships armored cruisers, cruisers scouts, the tor pedo flotilla monitors, gunboats, supply ships, hospi tal ships colliers, converted yachts, tugs and receiv

ing ships
As an (xample of the heavy expense of maintaining a big ship of war we may take the battleship Connecticut which was the flagship of the Atlantic feet during the last year. The pay of the officers and flect during the hast year. The pay of the officers and enlisted men of the navy and marine corps attached to the vessel and the expenses incidental thereto amounted to nearly \$800,000. This did not include the cost of the necessary repairs.

The home floot or the yessels attached to the Atlan the adde of the country, last year consisted of sixteen first-class battleships which were divided as fol-lows six of the 'Connecticut' class of 18,000 tons. five of the Georgia class of 14 500 tons, the and 'Mississippi" (lass of 13 000 tons each, the 'Missouri' and 'Ohio" of 12,500 tons each, and the "Wisconsin" of 11 500 ions. The average cost of keeping a vessel of the "Georgia" class in commission and on active service, which did not include repairs was mearly \$680,000, while that of the 'Idaho" and "Mis-sissippi' class was nearly \$530,000 each. The average cost of the 'Missouri" "Ohio" and "W While these figures will vary for the same ships in different years, the cost of maintenance will not change much from year to year for the same class. The total cost of keeping these sixteen battleships of the Atlantic fleet in active service last year amounted to more than \$10,500,000. It costs just about as much to keep an armored cruiser in active service as it does a first-class battleship, as is evidenced by the fact that the ten armored crubers which were in commission last year cost the United States \$7,000,000. Of these cruis ers in commission, six were of the "West Viginia" 13 880 ton class and the other four of the "Moulana" 14.500-ton class

With the increase in size of the battleshtps, then is a corresponding outlay for pay of the personner stores, maintenance, and repairs. The latest builds ships to be placed in commission, the "Michigan" and "South Carolina," each of 16,000 tons displace will require crows of more than 50 officers and will require crews of more than 50 officers and more than 500 officers and more than 500 officers and more than 500 officers and control of the state of the stat there is no denying that these exper

considered by themselves, are enormous, but when they are measured up against the vast nat. and our navy is sink into positive insignificanceto be the least costly, as it certainly is the effective, institution in that scheme of national rernment which is designed to protect the liver property and to further the happiness of the p

If the above seems to be a strong statemen. capable of easy proof The latest estimate on wealth of the United States available in the But wealth of the United Busies are more of Statistics is that of 1904, made by the Census reau which put the total for that year at \$107,104, may be regarded as the compor-ce against damage and loss of that 107 fill-id as such, it represents a premium of city-shundredtha of one per cent if we inclu-ent on the capital cost (400 million). 917, or \$1,310 per capita The 44 millions which navy cost last year may be regarded as the cost insurance against damage and loss of that 107 i four one-hundredths of one per cent the interest on the (apital cost (400 millions) of the existing fleet, the premium is only six one-hundred of one per cent while the cost of the "Florids" militons) which loomed so large in the eye of the captions critic at her launching dwindles to one one hundredth of one per cent of the wealth of the com-

## THE UTILIZATION OF SOLAR HEAT

F the heat of the suns rays were entirely converted into mechanical energy, it would furnish ore than two horse-power for each square yard of surface exposed to the sun, but in practice is is difficult to utilize solar heat. Attempts were made in France by Wouchot and Teiller in 1871 and in Sweden by Briesson in 1883. Mouchot and Teille d a conical mirror to concentrate the rays upon a boiler containing water or other voiatile liquid, but the mirror was costly and it gave only one horse power for 12 square yards of reflecting surface. Tellier, in sed the sun's rays to be absorbed directly by a lamellar boiler, containing a thin layer of water or more volatile liquid, such as ammonia or carbon disulphide. The same method has been recently employed by Shuman and Wiltsee in America. Shum employs the steam generated to drive a low pressu The boiler is constructed upon the principle of a greenhouse, i e on the property which glass possesses of transmitting the sun a rays but stopping turn of thermal radiation from the The boiler is a large vat coated with pitch and con-taining a layer of water three inches deep. An appa-ratus of this sort was operated in Philadelphia in

e also employs a lamellar boiler covered with glass, but the water heated in this boiler is us raporize the more volatile liquid ammonia or sulphur dicaide the vapor of which performs a closed cycle In California an apparatus of this kind with a boiler of 120 square yards of heating surface, furnished a mean power of 15 horse-power Wilface estimates the cost of the apparatus at about \$150 per square yard cost of the apparatus at about \$1.50 per square yard and calculates that it should aboons, at the \$41b parallel of latitude, about 4.000 calories per square yard per day. With these data about 1.50 square yards would farmish one horse-power and would cost \$80. For a large plant of 0.00 horse-power bowerer the total first cost per horse-power would be doubled. The cost of perstulent is about 3.50 cent per horse-power out of perstulent in about 3.50 cent per horse-power.

In experiments made at the agricultural station in experiments made at the agricultural station of Lausanne Switzerland, for the purpose of determining the effect of potash fertilizors upon natural meadowa, two neighboring fields having almost identical soils of glacial mari, showed a marked difference in effect and glacial mart, showed a marked difference in effect and very currousty, the soil of the field that had yielded the larger crop was found, after harvest, to contain more points them that of the other held. This remark-able result has been traced to the influence of drain-able result has been traced to the influence of drain-se. The better drainage of the field which replica-tion of the second to the second to a coluble until more, and caused the roots to extend to a greater water to the eight and utilize a larger volume of settle. This sci-ample shows that the fertility of a soil cannot always, be determined by electrical second. oth and utilise a larger volume to a soil caunot always ple shows that the fertility of a soil caunot always determined by chemical analysis alone.

### ENGINEERING.

TO MARKET TO THE STATE OF THE S

eg vigit a . T

Respictived computes continues to widen the range of its application. The Western railroads are preparing to build this semmer long stretches of reinforced concrets show sheds. These will not only be stronger than the present timber structures, but they will be entirely safe from the meance of fire

The independent goalline-driven rullroad motor cat, which we have frequently illustrated in this portrait, is growing in favor. A new car, 70 feet in length, is growing in favor. A new car, 70 feet in length, Rachester and Pittsburg Rallroad. This is the seventy-borth car of the types to be turned out from the product of the contract of the seventy-borth car of the types to be turned out from the shops, and it is the sixth car to be built for service cast of the Missistopia River.

The over-necessing weight of Western passenger trains is being must by a steady growth in the rise and power of the bocumentree. The Chicago, Milwauter As E Paul have recently travel out of their shops we types of siz-coupled simple locomotives, with epiloder 32 inches by 32 inches, one of which has "Shinch drivers and a tractive effort of 33 900 pounds. 4 the other Shinch drivers and a tractive effort of the property of the contract of the property of the contract of the c

### ELECTRICITY.

The conditions under which a street lamp should prove its afficiency are very different from those which govern the indoor lamp. This was brought out clearly in a recent address before the New York Section of the illuminating Engineering Society by Dr. Clayron it. Sharp. He pointed out that while in the building it. Sharp. He pointed out that while in the building lamp pass upward and be reflected by the celling in the case of a street lamp this would be a great facil for the vertical rays would be lost. Only those rays that are cast directly downward and horizontally up and down the street can be utilized. For this reason he has devised a reflector consisting of a pair of parabolic nitrores arranged to throw the rays in the direct bound of the deviation of the street can be used to be advantage. Thus, in place of having the street (lighted in spois, as is now the case, a more continuous illumination is provided.

The block signal systems of steam realizeds have witherto been operated with direct current from sicapo batteries. This has always been an expense on into the fincenselence and difficulty of maintaining the storage batteries. In revent times trolley roads have been using an aiternating current signal system which has been found to work very restlentor lifty, and the amountement has just been much that the Pennsylvania Railroad is about to install an after heading current block signals system on the lines tween tolicon, Osho, and the Grand Haspids and Italy an Railway This is probably the first instance of the use of alternating currents for steam railroad signaling purposes and if found satisfactory should do much toward extending the use of block signals on the directurement system is lumpared with.

In an article appearing in a recent number of the Miceric Railway Journal some very interesting con clusions were arrived at concerning the question of the coast of a street-car ried. The nicks luxer nicred for any, a three-mile ride in a street car is the very cheepest investment a man can make for coverhing this distance. Certainly any other method of trans man who walks to his work, if he is earning if centre part of the control of th

La view of the revent agitation in favor of using exteric headilities on locomotives, the experiments along this line by Prof Besjamin, of Purdue University, are most interesting. Prof Heajamin has claim under to be said against the clearly leading the most does the atrong beam of light bilind engine on locemotives coming from the opposite direction to the said against the clear of producing the signals. In one of his experiments the light of a given signal was extinguished, but when the light of a given signal was extinguished, but when the light of a given signal was extinguished, but when the light of a which appeared to the engine of the control of the c

Considerable attention has been directed of late to the inferious offect of vertain rays of electric lamps upon the subject was recently presented by Dr Stockhausen before the illuminating Engineering Society of London, and he pointed out that an excess fraction that there is the been appeared that the red and intra-red rays on account of their heat value, are very injurious. Hitherie it has been appeared that the red and intra-red rays on account of their heat value, are very injurious to the retina, but Dr Stockhausen does not believe that under ordinary resultings are very injurious to the retina, but Dr Stockhausen does not believe that under ordinary resultings in smallight, then rays inge the found in large quantity. The best rays for the human eye are the velocution of the pretrum of

### SCIENCE.

A telegram has been received at Harvard College Observatory from Prof. H H Campbell director of the Lick Observatory, tating that 'Frank McClean cables from Hobert, Tasmanis, steady rain, eclipse instable:

A new inflammable celluloid has been patented by Prof A Gautler The chief feature of the process is the employment of an ether silicate instead of pure ether, which is ordinarily used with alcohol as the solvent in the agglutination of nitrocellulose fibers by means of annhor

The University of Paris and the Parteur Institute have been authorised to renduce, jointy a laboratory of radio-activity located in Paris. This new laboratory will be alived in Invasion as excitons, one of their law review of radio-activity action of sections, the control of the Carle white the other will be devoted to medial applications of radio-activity and is placed under the direction of the Manner Institute.

What does 'gold filled mean.' Probably most people who lary gold filled watche fant's that they are mysteriously impregnated with gold. As a matter of fat, that term is main-ending. Gold filling consists in taking two sheets of gold between which is placed as section of solder-consists have mit. It his merel all sands in is heated and presend so that the three juries are welched together with the gold outside.

Dr. B. Barnard of Verkee Observatory informs as that despite the hase and tounds of the early morning of May 7th, 1910 he obtained fair photographs of Halleys come A tail about 40 dg fong anythen on the photographs To the naked eye it was only 17 deg or 18 deg long The head was of the second magnitude. On one picture the tail showed separately in three strands, some five or six degrees from the hold. The comet was a heautiful object on the mountage of May 4th and 4th.

In a recent bulletin based by his observators. Mr brivalus Joseph describes his nextly-discovered Martian smalls. These new canals are two in number and were discovered on September 20th 1990, to the cast of the Svriks Major where no canals had ever previously here are in They were most conspicuous Not a trace of them could be found in the record drawings of August July, June or May when this part of the planet was depicted nor rould any trace of them be found in the records of previous pears of them be found in the records of previous pears might be one that could have been seen before but was not yet the possibility of error seem sectioned by the size of the canals in question. He regards the vidence as trong that the canals are not simply new to us, but new to Mars. Measurement of the If diseases also show seen and some twenty miles wide. The Canyon of the colorade would be a secondary affair in comparison.

Light is of vry gard Importance to algor growing on the soa bottom and in their strungle to obtain light the plants assemble in structures of several storks. The algor of the genus Lemineria adhere to the rocks by means of disks. The wounds made in the plants by the attacks of animals become convert with a protective vereion in which the counties owners which the sea water contains become entangled syncars which the sea water contains become entangled similar manner by a second layer of plants or of small land in the sea water contains become entangled with a sea of the season of the

The mineral waters of Vichy Clermont Ferrand, Mont and Spa contain fluorescent substances in verminute quantities. The quantity of fluorescent matter often increases with the temperature of the water and diminishes as the amount of solid residue increases At Spa the amount of fluorescent matter has diminished by improvement in piping. The largest proportion is found in waters containing tarry con-silinents. These results are of practical interest in connection with the piping of mineral springs all natural waters whether potable or contaminated contain organic substances which are already fluor escent and others which become fluorescent when the water is heated to 266 deg F for half an hour Th ent of fluorescence is promoted by the addi tion of five per cent of ammonia. All such waters ex-hibit increased fluorescence when they are heated but this change is not produced by heating the water of a properly piped mineral spring because this water has already been exposed to a temperature of at least 266 deg F in the earth, and a second leading does not

The Lowell Observatory has issued a builetin en titled Preliminary Notes on Photographic and Spec titled irreliminary Notes on Protographic and spec-trographic Observations of Halley's Connet. The Observations consist principally of direct photographs of the comet and photographs of its spectrum as seen at Flagstaff Halley's count before April 18th had as Pagastat Itality's coinct before Auril 18th had shown to very striking chance, except in the diverg-ence or separation of the interal stransers. Negatives obtained on April 26th and 27th olsow marked chance in the form of the titl. On the 25th fit tall, at a short distance from the hand divided but parametrical row estimates from the hand divided but parametrical row estimates from photographs made on the follow limitation of the photographs made on the follow the monthing the fall was again outle necessity. side fram has On photographs made on the follow 10 morroug by tail was again quite narrow and straight On the 27th it was again branched. The most runstable changes noticed at Flagstaff in the come ta tail were observed on photographs made on April 10th and May 1st On April 30th the tail had completely changed in form The more or less bilasteral symmetry had entirely disappeared. The plates of May lat show for a distance of about 70 deg a tall well diffied with a gentle curvature, but beyond this point faint and diffuse. The outer parts of the tail on the hast two plates have the appearance of having been acted upon and shattered by some rather sudden and acted upon and shattered by some rainer sudgest and disturbing dishintegrating force. The comet's mearest approach to Venus occurred about this time. The question naturally arises, could the planet have been the disturbing influence? Comparisons of the disap-pearance of the comets tail for some days before and

pearanc of the comets that for some days sectors and after this event may fell us something. The great square of Pegasus acted as a splendid finder both for the comet of 1910 A and for Halley's comet. This mutual association of the two comets. comet. This mutual association of the two comets with Pegasus affords a good example of one of the chief difficulties experienced by those astronomers who have endeavored to trace Halley's comet amid the mass of brief and very general records of comets in actual objection. ancient chronicles

It is unfortunate that the chance of capturing a sample of the tail of Halley's comet was not soized The passage of the earth through a comet's tail is so The passage of the earth introduce a course which are an occurrence that no opportunity should be missed. In the April number of the Bulletin de la Société Astronomique de France, C. E. Guilliaume suggested the liquefaction of a large quantity of air which could afterward be treated by fractional distiliation, and possibly some cometary matter recog pixed. He pointed out that very minute quantities of the rare gases, such as krypton and argun, are thus secured from immense volumes of air and that it is now possible to ilquefy 1000 cubic meters of air per bour It is just possible that by this means a chemi-cal study of the comet might become a by product of an industrial operation

An investigation of Enckes comet by Dr Backlund shows that the acceleration of the mean motion of that body between 1895 1901 and 1904 was not con that body between 1886 1901 and 1904 was not con-sistent Dr Backlund suggeste that the resistance which would explain the phenomenon is a mateorial warm in the neighborhood of porthelion, and that the decrease of the acceleration must be attributed rather to the diministration of the density of the resisting ma-dium than to changes in the comet itself. Dr Back-lund also discusses the contact a fluctuation in bright-ium also discusses the contact a fluctuation in brightness, but offers

a while r sill Mr Sanger Shepherd has fitted the appa stus with a fine shutter, and in that case the receiv can be modified. The beam of light is then directed through the tunneled poles of the electro-magnet, and a pair of narrow compensated selenium cells is placed helind the slit, a positive lens being interposed. Any dot received shifts the fiber laterally, light fails on the selenium cells, and their reduced resistance allows a battery to actuate a relay which throws the tele photograph receiver into circuit

HOW THE "FLORIDA" WAS LAUFCHED

The launching of the 'Florida,' which took place strictly merording to schedule, at the Brooklyn navy on the morning of May 12th, suchly brilliant function in its technical aspects the launch was particularly successful, and we offer our congratulations to the naval constructors who our our congrammations to the nava constructors was were directly responsible. The ship is now tide up at the navy yard dock, where she will receive her side armor, which is already assembled at the yard, and her tarrots which are also about ready for placing. A most interesting feature of the day was a dinner in criebration of the event, given by the employees

of the yard who built the ship. This event at which some 1 200 were present, included among the speakers Vice President Sherman, Governor Gibbrist of Florida Winthrop of the navy, Adn stant Secretary Leutze, the commandant of the navy yard, Naval Con structor Baxter, and others. (apt Baxter referred to the strong personal interest taken by the whole force of men who worked upon the Florida" in the success
of the ship. To the Editor, who was present as a guest, the genuine enthusiasm raised among the m whenever any refer ence was made to the

ship. the yard, and Its officers weemed to he a strong indorse ment of the policy of ing at all times a battleship under construction at the New York yard

eral inquiries as to just how a battleship is launched, we have prepared the accomshowing a portent the isunching ways how The permanent "ground' ways con-sist of rows of piling driven to a solid bear ing upon which are spiked heavy, square timbers, or "caps," running transversely Upon these are laid series of honvy, longitudinal square timbers in three parallel lines, one immediate beneath the keel

and one on each side of the ship between the keel and the bliges During construction the weight is carried upon the keel blocks and upon hundreds of shoring timbers. When blocks and upon hundreds of shoring timbers. When the ship is ready for issuching and a few minutes before the actual issues the weight of the ship immaferred from the exists lacel blocks and the shoring timbers to the two parallel lines of issuesh-ing ways. Earl permanent way, built up of heavy, square timbers, presents a sliding surface four fact wide extending the shole heapth of the ship and down a considerable distinct firmly down to the cross cause and culture below. The lause blue, ways which raps and piling below. The launthing ways which are also four feet in width, are attached to the bull of the ship, and move with it down into the water Between the under surface of the launching ways the upper surface of the permanent ways is a thick cating of greene oil, and other inbricating substance The launching ways have to be moided to the form the abip for which they form a cracie, and our draw ing shows part of the cradle near the bow, which is known as the forward "poppets." The poppets con-sist of six sets of 14 inch by 14 inch timbers in groups of half a dozon. At their upper ends these groups of and a coson At their upper some these timbers bed against heavy angle iron bracksts, and at their lower ends they rest upon what are known as the "trushing timbers" long lines of parallel tim-bers four feat wide the bottom one of which forms the aliding surface of the launching ways. The abovethe aliding surface of the launching ways. The above-montioned angle trons are riveted to steel straps from a half inch to three-quariers of an inch thick and 42 inches wide which extend down below the keel and up to similar brackets on the other side of the ship

The space between the strans and the bull is filled in

with four inch white pine timbers, which fo bed in which the bow of the vessel rests. To assist in tying the whole cradle together, heavy wire ropes pass beneath the bow and are carried around heavy oak thimbies, placed on the outside of the pop Further support is given by 1% inch tie rods, which are drawn up anugly by note on the outside of the

The crushing timbers are provided through their entire length with a series of oak wedges interposed between them and the launching ways below About half an hour before the launch, hundreds of About hair an hour before the launch, hundreds of workmen range themselves up and down the wars, and by means of heavy sledges drive these wedges home, forcing the launching cradle into closer contact with the ship, and eventually lifting it sufficiently to clear it from the keel blocks, thus transferring the load entirely to the launching wave.

ings us to the consideration of the intering method by which the ship is held in piace, and prevented from starting off down its well-greased "to boggan" until the exact moment when the christening

longian until the exact moment was the curitating in performed and the order is given to let go. The locking and starting gear are as follows.

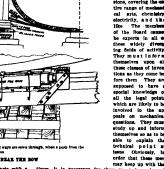

The hardwood launching ways are extended forward and strongly bolied down to the ground or permanent ways. After the wedges have been driven e, and the ship is resting on the inclined and well-greased surfaces it is prevented from moving solely by these boited connections. At the criti-(al moment, at the word of command, carpenters these timbers, and as the cut is made, a point is soon reached where the tensional strength of the remainof appeals understeers support of delay and expense, throws Commissioner the impossible tank of giving to commissioner tea mapositions take to giving to case the amount of personal attention proper to disposal, as demanded by law Lastly, the Edu Examiners-in-Chief, as at present constituted, state of three members, and no provision sists of three members, and no province made under the present law to supply a tem make under the present law to supply a computary vacancy caused by sickness, or other cause, with the result that the absence of one member sometimes re-sults in an unevenly divided Board, and in the conse-

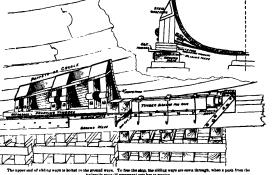

quent necessity for a rehearing. The absence of Cap members causes an entire suspension of business. At The enactment of Mr. Currier's bill into a law would ride an appellate Board, any three memi which would constitute a quorum, the prosecution all applications on appeal would be expedited, and the elimination of one appeal would mean the saving elimination of one appeal would mean the savingible the inventors of one appeal fore, attories; 'fees-she incidental expenses Leathy, one appeal in the Pauglie Office instead of two would give a reater stability for the decisions of the office irribunals, and would with the contract of the office irribunals, and would with intend in the past between the decisions of the Complexity of the

tor, who made a careful study of it and transit for the consideration of Congress. The pate n, as a whole, is in favor of the measure

> in-Chief, consisti ent. must deal with inventions from all at tire range of mech cal arts, chemistry, electricity, and the like The member of the Board cans be experts in all of these widely diverging fields of activity They must inform themselves upon all these classes of inven-tions as they come before them They are supposed to have a special knowledge of all the legal points which are likely to be involved in the appeals on mechanical questions. They must study up and inform able to explain the technical point at issue Obviously, in order that these men

LAURCHING WAYS AND CRADLE OF "FLORIDA" BEAR THE BOW

ing timber fails to hold the vessel. It parts with a loud report, and almost invariably the ship starts, slowly at first, and then more rapidly, for the water Occasionally a yearel will stick and must be given Occasionally a vessel will stick and must so gives a start. For this purpose, four heavy ramming time here are laid in position abutting against the end of the launching ways, with hydraulto jacks interposed between them, and heavy timber abutments. Should the ship "hang," a brief operation of the jacks is generally the property of the parks in the part of the parks in the parks in the part of the part of the parks in the part of the part of the part of the parks in the part of the part of the part of the parks in the parks in the parks in the part of the parks in the p

Reducing the Rumber of Appeals in the Poissa effici Mr Frank D Currier of New Hampshire introduce on January 21st, 1910, a bill the principal purper of which is to expedite the granting of patents in the Patent Office, and to eliminate one appeal in the office in his last annual report the Commissioner of Patents mended such legislation and advocated a n thich would combine the Commissioner, the l tant Commissioner, the Assistant Commis and the Examiners-in-Chief into a single appellate trii unal, any three of whom shall constitute a subrum, to which all appeals shall lie, whether from the Primary Examiner on from the Examiner in Interferences, and from which appeals would lie to the Court of App of the District of Columbia.

of the District of Columbia.

Thefor the present patent law in or peries came an appeal line from the Privatory Examiner to the Bunch Privatory Examiner or the American Commissioner's, and from his decision to the Court of Aprelia of the District of Columbia. In Interference cames, the course of appeal from the decision of the Examiner of Interference cames, the course of appeal from the decision of the Examiner of Interference is the same. This compares

where the second process of the second proce involve indumnum or pages. With only time on the Board, the time has come when it is nec to do something in the way of relief, so that p and correct decisions may be handed down. Just the Board is several months behind its work. T toe source is several months behind its work. The re-sult is that to get an appeal through the Board of Enaminary probably requires three to few months time. The bill in question save so much time in getting a case through the Patent Office. It practically provides six men to do the work that three are son' trying to do, without any additional cost.

At the present time, the same work is done owner vices in the Pentent Office for a very good prancy. The theory of the present course of aspinals is than suffer the destinate of the present liberal of Manufesty-ito-Diale, there will jui an appeal to the Compulsations in person. It is impossible for the Compulsations of person, it is impossible for the Compulsations of Patents in present, as given force, assistant plants. At the present time, the same work is don twice in the Patent Office for no very good

these things which are appealed to him. He has to have the help of his Assistant Commissioner, and he bigs, things which are appealed to him. He has to have the below it his Assistant Commissioner, and he size has to have the below of two others. The attac-tion is a second of the second of the second of or the Beard of Resonance-la-Chief, the only chance of the Beard of Resonance-la-Chief, the only chance the Beard and setting together and forming at optains on a case is atter hearing the agra-ments which are leaded by the attorneys. The Beard of the Resonance of the Resonanc ments which are made by the attorneys. The Board these tries to come do some conclusion at that time If it does not, then the work is to be divided among the members of the Board, and each one has to prepare his abare of the coses, and these spikin his heart of the coses, and these spikin his heart of the coses, and the spikin his should be the beautiful that the beautiful that the beautiful that he beautiful that the beautiful

## A PERSONANAL OIL GUSHER,

The largest oil gusher in the history of Californ to May 3rd it had delivered about 2,000,000 barrels

productivity During the two weeks following March 21st, 1910, more than one-half million barrels of high grade crude petroleum had been collected from the The stream rises intermittently from 170 to 240 feet above the top of the derrick, which, before the crown or top was carried away by the stream
of oil was 84 feet in height. The oil sands were the crown or top was carried away by the stream of oil, was 84 fect in height. The oil sands were struck at 2300 feet, at which point a tremendous gas pressure was uncountered and the drillers were sud denly amased at seeing small rocks huried hundreds of feet in the air through the eight inch casing. After the oil sands were struck, the well rapidly "drilled itself" to a greater depth The well promises to keep spouting fo

The well can be heard rearing for more than a mile. Spray from the gusher has been carried a dis-tance of two and a half miles, and hundreds of auto tance of two and a half miles, and hundreds of authoribles have carried sighteers from Bakernfield to witness the unique sight. The same brank for a distance of half a mile around the well is coated with oil, and several jack rabbits kittled well in the origin of the property of the grader has been proved unwalking, the force of the property of the derrick and fifteen feet of its uppermost structure, and the tremendous flow created a huge lake of oil extending for hundreds of feet on every side of the

From a money viewpoint the gusher is said to be the most valuable in the world's history, far exceeding the famous Texas gusher in the Beaumont field which caught fire and subsequently ran into salt water, for the owners of the Lakeview had netted by March 3its over \$300,000 from the oil, which is now being piped to tidewater from Maricopa in the San Joseptin valley to Port Harford on the Pacific count, a distance of 150 miles.

To control the oil from the susher was in itself no To control the oil from the guales was in itselfs as slight achievement. Shortly after the great stream annased the drillers, three pumps with a combined capacity of Spoob barries daily, were started working at top speed, pumping oil out of the sump-hole, and the oil so recovered was the first oil to enter the huge take built by the findependent producers of Califor-

The big well, which is one of the seven guahers 'Draught in' in the Coalings and Midway-Maricopa oil fields of California within the past month, is due on Besids of California within the past month, is due to the persistency of a single man. A discouraged beard of directors, three days before the gusher was struck, deeled to quit drilling. The order was given, but the superintendent conveniently farged it. He drilled if feet more against penalty of disminant, and figs bit entered the oil made.

the bit entered the oil made.

"To date all effects in city the well have proved un-publing, and the oil is now rushing heavenward both as the inities and the copied on the steal entage.

It is an interesting that that lately the gravity of the, oil; has risen from 11° heaven to 20°. This is to just the contract of the contract of 20°. This is held; taken to infected that the oil is now bring drawn large, a force subsidies or "pool."

## WEED-COTTING BOATS.

To the Editor of the Schwitze American
I have been a constant reader of the Schwitze
American for, I think more than thirty years—back as far I can remember, anyway In the issue which I received Saturday, I noticed an illustration of a weed-cutting boat and a description sent by your Paris correspondent. While I do not know that there is a specific statement in the article that it is a new scheme certainly one can only gain that inference from the

ading
While I do not remember to have seen a weed-cut ting boat exactly similar to that one, they have been in use in this country by many of the ice companies for many years. The Consumers' Company of this city, of which I was vice-president and general manager for a good many years, something like ten years ago buil a boat at their own works for this purpose and while a boat at their own works for this purpose and shifted owing to the fact that assoline engines were not their so universally used as at present atent power was cutting kilving, yet its purpose was the same and it accomplished the same end and in my judgment was in some respects better than the French device. As I remember it, we merely built a flatboat about ten feet wide and forty feet long. We mounted the wheel stern, after the manner of Mississippi Rive steamboats, instead of at the bow as in the French boat and we placed the cutting knives a the box They were about the same type as those used on mow ing machines and were operated by the same engine that propelled the boat. We morel used a small up that propelled the boat We more) used a small up-right boiler and a single-cylinder vertical engine for power, transmitting the power to the stern wheel by chains and to the cutting knives by bevel goars and Right at the front end of the boat (onvent abaffing Right at the front end of the boat conveni-ent to the pilot, was a clutch for throwing the cutting knives in and out of goar. The knives were raised and lowered by a goar controlled by the same person. This boat at times was run by one individual. Of course, it was better to have two-one as engineer and the other as pilot. It was arranged to cut to a depth, I think, of four feet

I know of several boats of this same character u I know of several boats of this same character used by various secondants and I think in one return they are very much better than the French boat as the euting knive are in from, and the pilot know just what he is doing all the time and of course, he can run the beat very much shallower he caps of the cut the weeds out in very much shallower sater. Then again, the French boat runs other beat were the shore the course of the rashes, pushing them down possibly so that the weed cutting knives would not cut them at all Chicago, Ill

Booth of Prof. Augstrom.

The well-knows Swedish physicist, Dr. Knut Ang strom, is dead. To the general public his passing will mean little, because his investigations were not of the character that attracted public attention. To the

the character that attracted public attention. To the celemitath is death means an aid case for in him physics has been deprived of one of its abbest investigators. The control of father, Johan, achieved frame by reason of his sphendid study of the solar spectrum Ills gam. Knut was born in 1807. He studied at the University of Upsain, where he afterward taught. Ill occupied a profes-count of the time of the control of the control of the control of the time of the control of the control of the office of spectroscopy. By means of the spectroblometer

sorial chair at the time of his death
Angstrom's first researches were made in the field
of spectroscopy By means of the spectrobolometer
he studied the phenomena of absorption in the infra
red spectrum, notably for carbon monoxide, carbon
dioxide, water vapor and osone These investigations gave rise to an interesting controversy with Arrhe-nius. Water vapor, carbon dioxide and ozone have a marked influence on the temperature of our globe In effect, they partially hamper the radiation of the earth into inter-stellar space and thus sid in main laining the surface of our planet at a temperature compatible with the conditions of life. With these fights up a basis, Arrhenius built up an ingenious

theory to account for the glacial period. He suppo that the quantity of carbon dioxide contained in our sphere has increased since that period strom proved that Arrhenius' reasoning was valid only for carbon dioxide of almost infinite tenuity and that the possible variations of the tenuity of carbon dioxide in the air could not possibly have had any influ on the temperature of the earth

Angstrom's name will be forever linked with the study of solar radiation. An instrument which he in vented for the purpose of measuring this radiation and known as the Angstrom pyrheliometer is now widely used in observatories.

The (arrent Supp

The government dam across the Salt River at Room teit, Arizona is nearing completion after about six years of active work. The dam is excellently described and illustrated in the opening article of the current Super-Mayer No 1794 by Edmund G kinyon in an article entitled "New Methods of Polar Explorations the forth oming expeditions of I leut Withelm Filch ner and Capt Scott are described in detail as well as ner and Capt Scott are described in detail as well as other expeditions. The current problems of most in-terest to those engaged in the branches of science associated with marine construction are usually brought into high relief at the annual meeting of the noting in the light refer at the annual mesting of the Institution of Naval Architects. In the present year this has been particularly the case A summary of the Institution a proceedings is presented. The Insuguration of the Oceanographic Museum at Monaro took place on March 28th in the presence of representatives place on March 28th in the presence of representatives of the governments of France Germany Italy, and a great gathering of men of all ance of all nations who were invited by the Prince of Monaco. The museum is made the subject of an increating illustrated article. Dr. E. E. Barnard of Verkew Observatory has made as special study of the automatic field of the properties leys comet will I as directly between the sun and the earth and its tall will sweep over and envelop the earth. In this connection it is interesting to note the earing in this councilion it is interesting to note that a miracle book of the sixteenth century mentions the pash. 3 of a very large comet between the earth and the sum and a phenomenon apparently connected therewith The (frommatnews of the passage as given in the work are published. Perhaps the biggest comet. in the work are published "ranjw in niggest comer of the ninetwenth century was that of Donati which appeared in 1858 At the time Charles Dickens was Editor of Household Words in the pages of which magazine there appeared an interesting article on the appearance of the comet—interesting because of its attempt to present the phenomenon in a popular way and also curious in the light of our more advanced cometary knowledge Visible Molecules Corpuscles, cometary knowledge Visible Molecules Corpuscles and lone is the title of an article in which the mod ern theory of matter is discussed

## A Stabilizer for Aeroplanes.

Regnard has designed an automatic device for steadying the flight of un neroplant in which use is made of the invariability of the axis of rotation of a made of the insatiability of the axis of rotation of a gyroscope For stability as un eroplane however it is not necessary to have a gyrosist of great mass, act ing directly upon the axis of the aeroplane. A small gyroscope, weighing only a few pounds suffices to establish the tric contacts in the frames which contains it. By means of these contacts currents are sent through motors which operate the steering organs of the aeroplane Two motors are required for this pur ut they may be very small and light be they act upon the rudders by means of levers nerd has not yet had an opportunity to apply his in vention to a real aeroplane but he has submitted to the French Academy of Sciences a model of an acro the French Academy of Sciences a model of an acro-plane about three feet long resting on a box which contains a gyrostatic stabilizer. When the system is inclined in any way the steering organ, whose function it late restore the axis to its original position, is at once automatically act into motion.

### What One Firm Pars for Patents.

A recent report of the General Electric Company covering the period of the eleven months ending Decovering the period of the eleven mouths ending De-cember 31st, 1999 consists some runarkable figures. During the facal year the company paid for patients and patent litigation the sum of \$900.50° which sum is not counted as an asset but is charged over to profit and loss. All the company a valuable patents fram chiese and good wills stand in the balance sheet at a nominal valuation of one dollar

Mr Richard Blees an inventor who did much t achinery of various kinds, died recently a improve machinery of various kinds, died recently at Richmond Hill, Long island, at the ripe age of 9: years He patented the Culver awitch and the first scaling indder used by the New York Fire Depart ment Hydranic water pressure systems for sky acrapers and improvements in sewing machines are a to be credited to him

# THE MANUFACTURE OF TWINE

BY DAY ALLEN WILLEY

What is generally known as hemp twine, used in such enormous quantities for various purposes, is manufactured from two varieties of aber known as Manila and Sisal Needless to say the first named comes from the Philippine Islands forming one of the principal products of this possession of the United States while the Sissi is secured principally from Mexico the Siste of Yusaan contributing the larg est supply. An idea of the extent of Manila hemp manufactured can be gained when it is stated that each year no less than 125,000 tons are shipped from e city of Manila most of it coming to the United

The aber from the Philippines is obtained from a

verted into fiber. This is done by the usual method of decortication. The material is fed into the receiving hoppers of the mill by means of an endless conveyer, the leaves being laid upon the surface of the voyer, the leaves being kild upon the surface of the conveyer side by side By means of tootlod wheels they are cut lengthwise into shreds. In this state the material is passed through mechanical cleantry which remove all of the pulls. Next the fiber passes out of the decorticator and is carried to yards adjacent to the mill, where it is hung upon lines and dried by reposeur to the heat of the sun This process con cluded, it is pressed into bales of conven is then ready for shipment to the United States. already stated, the preparation of Manila fiber is done

almost entirely by hand, and bealmost fore being export ed it is also dried ed it is also dried in the sun, the natives using long poles, how ever, instead of rope or wire as at the Moxican

Mantla and Sizal fiber into the

The state of the s

species of the banana family, which attains a height of fifteen or twenty feet. The stems of the separate leaves grow in a close cluster ing what appears to be a solid tree trunk, to the height of ten or twelve feet, where they separate and branch out like the limbs of an ordinary

natives out these stalks off The natives ut these stalks off near the ground removing the leaves from the top of the stalk, then repeated in the stone and respectively drawing it arrow the edge of a dull blade pressed on a block of wood This primitive method or cleaning the Manlis fibr has not as yet given place to modern method. The work of the decision of the dull the stalk of the decision of the decision

This work of growing and cleaning the fiber is con fined to the mountainous districts. After the fiber has been dried it is packed in convenient sized bun dies and brought down to the coast villages where it is purchased by exporters, who sort the fiber and press it by machinery into bales convenient for ship-ping. These bales are protected by mattings woren or platted from rushes by the natives, and are secured by ratten bands

The Henequen plant furnishes the Sissi fiber which The Henequen plant furnishes the Sissal Sher which is brought to this country. The plant bears a re markable resemblance to the well-known century plant and is frequently mistaken for the latter on account of its appearance. As it forms one of the principal products of Yucatan the Sizal plant is cul tivated on large plantations, principally by Indian labor The young plants on these plantations are set out in rows about ten feet apart. About the fifth or sixth year the plant is sufficiently matured, so that the under and larger leaves are cut, and the pulp removed by decortication, leaving the fibers to dry the sun, they are then baled ready for market The plant continues to grow and produces about a dozen mature leaves each war. At the end of a period ranging from fifteen to twenty years the plant dies, and is replaced by a young one
The method of gathering the Sisal and shipping it

The method of gamering the Sussi and snipping it to market is much more estimated than the process employed in the Philippines, for nearly all of the Sisal plantations have transways extending through the Henequen fields, so that as fast as this curious harvest is gathered it can be leaded directly on cars and drawn by mules to the factory, where it is con-

Machines for balling the twine.

is performed by practically the same process. The interior of the modern twine fac-tory is somewhat similar in appear-ance to that of a modern cotton mill, with the exception that some of the machinery utilized in the lat

titlings in the latter is missing This
Is due to the fact
that less care is
required in the preparation of the fiber for spinning, since its appearance usually does not increffle the value of the finished product. As is well known, the preparatory machinery in a cotton mill is by far the most elaborate apparatus installed. It includes the opening and scutching machine, by which the material sed from dirt and other foreign partic the fiber is not a mass of that like raw cotton, this mechanism is not required, nor is it necessary to form it into bats preparatory to carding In the modern vites mill, however, the fiber is passed through mechanism which is somewhat similar to the carding spite and performs the same duties, disentangling the fiber by means of revolving cylinders provided with cards which are suitable for treating much corrier material. When carded the fiber is drawn into a control of the card of the fiber is not a mass of lint like raw cotton, this

0.0

movable racks or the floor. This is the first process in preparing the bemp—for such it has now become—for spinning, but before being conveyed to come-for spinsing, but before being coaveyed to this apparatus, it goes through what is called the finishing matchin. This combines in part the draw ing and subship frames of the cotton mill, so the been considerably reduced in size and is allowed has been considerably reduced in size and is allowed, twisted, enabling it to be coiled in cans, from which it is fed to be spinning framies. While the apinning matchine is of course designed for treating this flow encountry. splaning machine for course designed for treating this liber especially, it is as automatic in its open-tion as the motorn satisfacting mechanism, and pi-tion as the motorn satisfacting mechanism, and pi-tion fainted product than its required in the mana-facture of yars and thread from the ordinary cotton. The twine spinning machine includes drawing roles for longthening the allow; the material as it is made to the contract of the contract of the course of the form them being twisted by the action of the appliable from them being twisted by the action of the appliable mounted upon carriages which adjust themselves at

As fast as the twine is spun it is also wound on a large spool or bobbin the latter being taken to the balling machine as soon as it is filled with the twines.

The balling machines are also automatic in their operation, not only winding the ball from the bobbins. operation, not only winding the ball from the bobbing but discharging the finished ball automatically whose it has reached the proper dimensions. These mas-chines are siculated to wind balls weighing five pounds each where the twine is used in connection with binders and other agricultural machinery, the balls being packed into cases bolding ten each.

At the McCormick plant, which is illustrated in the accompanying engravings, several grades of hemp twine are produced, one of which includes the mix ture of Mexican and Manila fiber, as this is found to be very durable To show the difference in the of the material it may be said that a pound of such twine contains 600 feet. The twine made en tirely from Manila is slightly floor and averages 650 feet to the pound, while the Bissl is the coarsest, averaging 600 feet to the pound

Educating the Parmers by Rail,

California sees a way to solve the food problem by educating the farmers.

She believes that the farmer is nover too old to

Bales of twine ready for shipment

## THE MANUFACTURE OF TWINK.

She also believes in teaching the young to be farm-

Accordingly, the State maintains a college of agriculture, a university farm, polytechnic school, United States experiment stations, etc.

Now she proposes to introduce the study of agricul-ture into the public schools of the State. A substantial beginning in this line has already been made in the establishment of the study in the

high schools, later on it will find a place in the

primary and grammar schools.

Then California has its farmers' club, granges, and farmers' unloss scattered all over the State, and these corganizations exercise a large influence upon the educational thought of the day.

cational thought or the say
Every year some hundred or so have institutes are
held in various parts of the State and yearsh anguality
between 20,000 and \$8,000 farmany.
California has the best ormanance horizontages, spen-

tion in the world, comprising a central office and a insectary at Sacramento and a quarantine de-ment in San Francisco. State in parts

Each county covering a horticultural section also has its own local commission, inspectors, etc., while t fruit growers hold two State conventions annually

These all wield a strong educational influence and add largely to the sum of farm knowledge in the

But the latest and most striking feature of Cali fornia's campaign of farm propagands is the so-called "Agricultural and Horticultural Demonstration Train."
This train is the joint work of the California College

of Agriculture and the Southern Pacific Company, the one supplying the exhibits and corps of lecturers and

This led to the organization of the "Agricultural and orticultural Demonstration Train"

Horticultural Dem And it only needs a glance at California's industrial statistics to convince one of the truth of this charge

or wasterul nesonatory.

California thirty years ago was one of the leading wheat-producing States of the Union. In the year 1879 its wheat output amounted to not less than 1-707,800 tons, in 1994 the annual product of wheat had dwindled to 465,028 tons, a shrinkage of more than

seventy five per cent.

California was formerly a great exporter of wheat and flour. In the year 1882 she exported not less than

1.128,031 tons of wheat and 919,898 barrels of flour In 1904 her exports of wheat had dwindled to 54 381 tons and flour exports to 882 486 barrels. To-day both the ex port of wheat and flour are wil

import a million dellars' worth of wheat annually in order to keep her mills running, and her flour up to standard grade And all a result of poor

farming, as is evidenced by the fail of the average annual yield per acre of wheat from forty to less than fifteen ticultural lecturers cover a wide field, including plant culture, plant diseases, and plant peats, viticulture, ani-mal industry, dairying, seeding and soil treatment, etc. secial stress, however is laid upon the vital im

portance of restoring the lost fertility of depleted soils and the maintenance in their composition of that and the maintenance in their composition or una-vital element known to agricultural sciences as hu mus, all of which has a direct bearing upon the increase in the production of food-stuffs sufficient to supply the demands of a constantly increasing population

## Pire (ontrol in the National Forests

Probably one of the best things in the line of an agreement has just been algaed by the Secretary of Agriculture and several railroads whose lines run ignide of the national forests. Two of the largest and longest roads in the Northwest (the Great North ern and the Northern Pscific) have right of way through some of the richest timber districts in the

West and this agreement is of great benefit They have in view both the reduction to the lowest point of fire risk from the operation of the railroads and joint action by the Forest Service and the rail roads to fight all fires which may start along the lines. Both companies have agreed to clear and keep clear of inflammable material a strip of varying width, ss conditions demand, up to 200 feet beyond the right of way, and to provide all locomotives which do not burn oil, with suitable spark arresters and other

standard equipment to prevent the drop-ping of fire An effort will also be made by the companies to so operate their en gines as not to cause fires.

gines as not to cause fires.

In fighting free the railroads and the Forest Service will co-operate closely Noti fication will be made promptly to the Forest officers of all fires discovered by employees of the railroads Telephone wires to make this possible will be put up

demonstrators, and the other a fully equipped railroad train comprising three exhibit cars, a lecture car, a sleeping car and diner, all absolutely free of cost to

The work of the train is arranged in a series of annual tours, covering all the leading agricultural and horticultural sec-

s of the state ach series consists of five separate tours, each tour covering from 500 to 1,000
miles, and from twenty to twenty five stopping places. The work of the train begins in the late

fall and ends in the late spring. It does not specialize like the demonstration train of the East but covers all

the leading lines of agriculture and horticulture
Its corps of lecturers contains some of the ablest
members of the faculty of the College of Agriculture, and the president of the university, Benjamin Ide Wheeler, frequently joins the train in its course, and lends his aid to the work of general farm enlighten-

The Southern Pacific Company very candidly admits its own interested motives in the premises, and frankly explains that it discovered a serious falling off in its local tonnage, and when the matter was in vestigated it was discovered that the shrinkage was found in the item of farm produce

They consulted their local freight agents as to the underlying causes, and were told that the principal cause was an exhaustion of the soil

This was hardly believable, and the company con suited the soil experts of the College of Agriculture who denied the theory of exhaustion, but explained that the soil had been depleted by a practice of pocultural methods.

mbing out the hemp preparatory to shipm

It is this era of wasteful farming that California desires to put a stop to, and hence in augurates her campaign of agri cultural education

The "Agricultural and Horti-

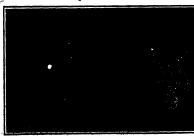

rine "Agricultural and Forticultural Demonstration Train"
is developing unlooked-for efficacy it was originally latended for the enlightenment of the
present generation of farmers, but its inducace is
being carried beyond that limit, it is being brought to bear upon the rising generations, and the young folks are fully as much in evidence at the lectu onstrations as the older ones

At each stopping place for lectures the local schools of all grades are dismissed and the pupils allowed to attend, a privilege that is evidently appreciated by all attent, a privilege that is evidently appreciated by all They crowd the demonstration cars and heture car, attend open-air lectures, lectures and discussions in neighboring school rooms, public halls, and opera houses, and are found in attendance whether the gathering be in the daytime or in the evening

Winding the material into canisters for spinning.

by the Forest Service using the companies' poles where this is possible Warning whistles will also be sounded by loo modifies on occasion Forces of fire fighters will be assembled on the out-break of fires, and will be made up of Forest officers, railroad employees, and such temporary labor as can be gathered by either. The cost of fighting fires which start within 200 feet of the railroads will be borne by the companies and of all others by the Forest Service, unless it is shown in the first case that the railroads were not responsible or in the second case that they were responsible for the outbreak of the fire the intention of the Forest Service to patrol the rights

Preparing the homp for spinsing

# DAMMING THE MISSISSIPP

BY W. P. GREEN

Excelled only by the monster dam across the historic Nile River, the greatest ingineering feat in the natory of the Manda Wax is unter vary out to east stadppl at Keckuk loss the point from which Col Rossvelt started his river journey to the far Wat several years ago. A huge dam is being built across the Mississippl at the foot of the rapids which lie to the north of Krokuk, and the stored energy of to the norm of a count, and the stored "neep" of the river is to be used in generating over 200 one electrical horse-power. The power will be distributed throughout the Middle West, the first long distance transmission line running to 8t Louis 170 miles. south of Keokuk where forty per cent of the power to be developed is now under contract. The bed of the river at this point affords an excellent rock foundation.
The dam will be built of reinforced concrete, and
over 500,000 barrels of cement, and 7,000 tons of steel required in the construction of this gigantic

he dam, including abutments, will be 4700 feet

of 43 feet. On top of the spillway will be placed 116 steel flood gates, 30 feet wide and 11 feet high, supported by concrete piers. The piers are to be built integral with the dam, being carried down to bedrock on the upstream aide. They will support an arched bridge, from which the gates will be operated by electric hoists. Through the manipulation of these gairs the water above the dam will be maintained at n constant level at all seasons

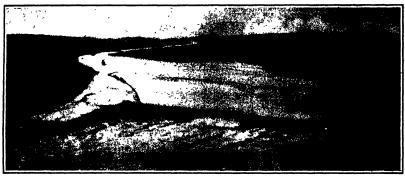

Four fifths of the dam, the 4,400-foot section, will extend in a straight line across the river, breasting the current of the broad river. The balance of the dam will be built approximately parallel to the shores and at right angles to the main dam. This portlon, i 100 feet long 123 feet wide and 133 feet high, will be occupied by the power house. The substructure, built of massive concrete, will contain the water passages and waterwheel chambers. Upon this will be the superstructure containing the electric generators, transformers and switchhounds. There will be thirts

the power house, will be the revolving parts of the

generators. To keep fonting loe and logs from entering the power house, an foe fender will be built upstream from the upper end of the power house, curving in toward the shore This will be 3,800 feet long and built of concrete masonry.

The construction of the dam will entirely destrthe government canal, built to carry shipping around the rapids. This canal new consists of three locks. In its place a single large lock will be built. There in its piace a single large lock will be out. There will thus be substituted for the causal q lake of deep water over a mile wide at the dam, and 40 miles long. The government has given permission to build the dam, Landowners on both sides of the river will be given a fair price for all land overflowed as the result of the creation of the reservoir

The construction of this gigantic river project is under the direction of Hugh L. Cooper of New York city The work of excavation is well under way on

This happ structure, over a mile in length is being built across the Mississippi at Kookuk, Iowa. The dam, which is broadly similar to the Assonan fam across the River Nile, is provided with 110 food gates to could be height of the foods. A lake 40 mum long will be formed and ultimately 200,000 electric horse-power will be generated in the power house shown at the laft of the dam.

## THE RUGE DAM WHICH IS BRING RUILT ACROSS THE MISSISSIPPI

long, or seven-eighths of a mile. The spillway section will be 4,400 feet in length. The dam will rise 37 feet above the river bed, and the base has a width

power generating units each consisting of a vertical sirel shaft, carrying on the lower part two turbines, or water wheels. On the upper part, on the floor of

the Illinois side of the river, the project will be pushed as fast as the material is delivered at the site

## The Commographic Museum of Monaco.

The Oceanographic Mineum of Monaco was form ally opened on March 29th, 1910, by its founder, Prince Albert I of Monaco, in the presence of representatives of various foreign governments. The celebration in cluded a pyrotechnic exhibition and an allegorical pageant in the beautiful bay of Monaco, a gala per formance at the opera and other festivities. The new museum, which is also a laboratory, is connected with the Oceanographic Institute of Paris and both institutions, with an endowment of four million frauer (\$800 000) have been presented by Prince Albert to in recognition of the hospital the French governm ity which Paris and France accord to all workers in the field of thought Prince Albert is president of the administrative council of the Institute, which in the administrative council of the institute, which in cludes among its members at President Loubet and the physicists Cailletet and Becquerel The direction of the scientific work is confided to an international committee for it was Prince Albert's design to found an institute and a laboratory in which investigators of nalities could work together for the advan ment of the new science of oceanography The lecture courses of the Institute were inaugurated in 1803, at the Conservatoire des Arts et Métiers. The lectures been given in the old building of the Acad emy of Medicine and at the Sorbonne. The new building of the Oceanographic institute will soon be completed, and the lectures will be given there after

The Oceanographic Museum of Monaco, which has aready received the popular name of the Paince of the Sea, is built on the flank of a steep cliff at the edge of the Sea. On the water side the building is 255 feet high, while the height of the main rande on the land side, is 148 feet, the difference being due to the

slope of the cliff The length of the building, parallel to the water front, is 330 feet. The cost of construc-tion exceeded \$1,500,000. There are only four stories, and the rooms are very high, large, and well lighted The two lower stories which are partly underground. contain the aquariums and laboratories, while the up-per stories are devoted to the exhibition of sounding and other apparatus, and of the rich and varied collections of deep-sea fauna and flora which represe result of a quarter century of exploration Princ Albert has also placed a small steamer, the "Eider," at the disposal of the Museum

at the disposal of the Museum Almost every year since 1886, the Prince of Monaco has made a scientific cruise in the Mediterranean, Atlantic or Arctic Ocean The experience acquired has made a scientific cruise in the Mediterranean, Atlantic or Arctic Ocean The experience acquired with the "Hirondelle," a salling secht of 200 tons, and afterward with the "Princesse Alice I," an auxiliary three-masted schooner, 170 feet in length, was put to good use in the construction and equipment of the "Princesse Alice II." with which the later cruises have been conducted This vessel has a steel hull, a length of 240 feet, a breadth of 34 feet, a displacement of I 400 tons, and a maximum speed of 13 knots. It to tains the most improved apparatus for taking soun ings and temperatures and collecting specime fauna, flora, sand, mud etc, at very great depti great part of this apparatus was invented and con

great part of this apparatus was invented and con-structed by the Prince and his assistantic. The cases of the Museum contain representative of all known deepnes fauna. Many of their speci-mens are interesting even to the non-selectific ob-server because of their strange forms, heastful colors, and poculiar organs of sight and touch. Three occanographic explorations and collections also possess great practical value, in addition to their

also possess great practical value, in addition to their scientific interest. Most edible fishes feed upon the

plankton or mass of small animal organisms which are wafted hither and thither by even feeble ocean currents.

The explorations have proved that the plankton moves in a manner dependent on the season and the locality These migrations appear to be governed by complex laws, the knowledge of which, as it is grad ually developed, will be of great value to the fisheries, especially to the steam fisheries, as the fish follow the plankton

plantion in commemoration of the inauguration of the Ocean carpable Museum, the Prince of Monaco has custed and the Commemoration of the Prince of Monaco has custed to god plaques were presented to the president of the French Republic, and the soversigns of Germany, Italy, Spein, Portugal and Monaco. AMMORIA FURITIES FOR REFERENCE PLAYS.

A recent patent discloses an improved method of purifying ammonia, so as to reader it anhydrous in refrigerating plants. The object is to produce a high grade of subdytous ammonia continuously while the compressor is in operation. An apparatus is provided which is connected in circ uit with the compressor and condenser and removes a portion of the best from the compressor and memory and portion of the post from the compressed ammonia so as to condense the oil and water vapor and permit dry or partially cooled but uncondensed ammonia to be delivered to the concendance oil in this way the amount of cooling that

APPARATUS FOR PURIFYING AMMONIA FOR

is required in the condenser is reduced. The passage of oil to the condenser is prevented and the ammonia is condensed sparatially, so that only pure anhytrous ammonia is delivered to the expansion valve. The apparatus compress we holders or drains A and B which are connected at the bottom by a pipe C. This was a connected at the bottom by a pipe C. The compressed ammonia enters the drain A, through a pipe B then passes through one or more connecting pipes B to the drain B after which it passes out through the pipe F. The cooling system consists in a pair of water chambers of and a pipe B, connecting the top of the water chamber in drum B with the bottom of the chamber in the furu M. The safer passes through the cooling system in the reverse direction to the flow of ammonia through the apparatus. The temperature and rate of flow are so controlled that holders, but all the oil and water waper which may be carried slong with the ammonia will be condensed in these holders and excuminate in the lower portions If the valve in the pipe C is opened, the oil and water in the drum A is to best the oil and water will flow into the bottom of the drum A and may be draven off at that point. The object of letting the water in the drum A is to best the oil and water to the drum A is to best the oil and thus prevails and the province of killsouri A veloce and Millsouri A veloce and a veloce and water in the veloce and water in the veloce an

## CONVERTIBLE BOAT AND TENT.

OFFICIALE FOAT AND TENT.

For the benefit of campers, hunters, and the like, a folding tent has recently been devised which may be pecked late a very small compass and which may also be soatered into a canvas boat. Our illustration shows the device in its two forms, partly broken a way

to reveal the framework. It will be observed that the upper portion of the test comprises a pair of lasy toggs A, consected by trous har B. These are supported on four posts indicated at C and B, and the structure is readered quite rightly means of a system of gay wires. Swung from the framework are a tuper portion of the int frame is evered at this variety proof cauras, and in addition to this, there is a lower proof cauras, and in addition to this, there is a lower cauras section which may be featened to the upper section by means of buttons, thus forming a specious test, and the occupant cas also not not contained.

CONVERTIBLE BOAT AND TENT

which has decided improvement over nature the ground for a bed. When breaking rempt to pooke C and D are withdrawn from their sockis and the lary tonger folded up, so that the entire framework into a boat it is extended and inverted, so that the urons a bars B form the bottom of the boat that the vrose bars B form the bottom of the boat that the vrose bars B form the bottom of the boat the large three boats of the transverk at one end and fastened together at their native with a tone end and fastened together at their native is braved by a pair of arms M which are histories to start a set of the large to the

## INDEX STRUM FOR POCKET MEMORANDA

A patent has recently been granted on an Improved problect momerandium book, which is provided with a novel indexing system. The first leaf of the book is abouter than it in others and serves as a topic, itse, being ruied to allow of entering various topics on which most are to be kept. The other leaves of the book are cut with series of take as shown in the it instration the tals on each leaf corresponding in number to the topics provided for in the topic last when notice on a subject are entered on one of the haves the notice of the service of the servi

The libratinated civator threshold is a new means to prevent what is a quite common form of elerator section! The elevator attendant, making hundred of stops in the course of a day, is not always enabled to bring the car to a hait at the exact more large, and a very slight variation is sufficient to give the passen ger a joli if not more serious injury. The floor of the care being belof an inch or two above that of the

building is likely to trip the unguarded person about on eater the car, while persons stepping out are liable to be thrown down. The latest method of avoiding this is the teartion of a part or plate pine lease in the metal of the threshold, with an incandecest kamp under each. These are kept in operation all the time the car is in use. The lamps are supplied through the elevator cable in the same mannar as the overhead lamps. This device has been tried with seminent success in some moving-picture establishments, where the rear seals are slightly above the level of the skile.

The jobbing expenier moving around from one place is another, and locating for a few days at a time in one apol. In the cqurse of his peripatatic cares is compelled to spand considerable of his time in the construction of wooden horses or treaties, which are sensually so measurally not measurally for his work. These things are of such an awkward shape and size that it is out the question of the question to carry them from point to point, so he is compelled to built them in many cases before the in proceed with his work. To meet such demanda, horses of steel with collapsible for have recently been made, so that they may be readily packed up on the back of the treate when not in use and when on the back of the treate when not in use and when being transported, and in this form they are very compact. Being of angle iron, the treatie is not heavy and is almost everystating

### ODDITIES IN INVESTIONS.

HAT FARTYRE.—The recent agitation against long hatpins has et a Yankee investor to thicking. He has arranged a hatpin which has no exposed point and which does not have to be removed from the hat, but which may be operated to engage the half by giving it a bail turn. The hatpin extends from side to site of the crown of the bait, and is provided

A HOVEL TYPE OF HATPIE

with a series of hooks or grapples sharply pointed at the ends, so that when the pin is turned they will hook into the hair Whether the hat fastener has been tried in actual practice we do not know but it seems as if there would be considerable danger of entangling the hair in the curred hooks.

Device you beaving or any Bandonso Operation—An inventor does not have to go for affeld for observed upon which to exercise his inventive faculties. Even in the most rommorplace matters of everylay life there is room for improvement. Take, for instance, the mothod of removing one's overshore the musual way of teetering on one foot while trying to kick the shoo off the other foot is most sewward, to say

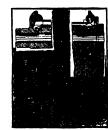

DEVICE FOR DRAWING ON AND REMOVING

the issue Recently, an inventor has devised a little attachment for the came or universite, whereby one can stand firmly on one foot and steady himself with the unbrella while removing the overshoe by pressing the lug at the back of the overshoe against the attachment on the unbrella. The investor has provided a

more elaborate device to hold the overshee in place while directing it on. The log at the held of the ownshoe is so formed that it on he engaged between a pair of jaw clamps, one of which is fixed while the other is princepotated. The drives is applicable to a case, and running from the movable jaw to within a coversiont distance of the head of the came is a

a cane, and running from the merable jaw to within a convenient distance of the head of the cane is a rod, which may be litted to release the jaws. Lucarnova Gurs Steurns.—When using a gun in the dark or deep twilight, it is very difficult to secure accurate aim, because the sights are invisible This difficulty has frequently been experienced by sentries,

LIMITEONS STORES FOR PWILIPET SHOOTING

no should be able to cover an approaching ensemy with accuracy, in order to secure belief own analyte aw well as that of the camp. To enable this to be done, an invention has recently devised ag un in which the sights are luminous. This is effected by means of a pair of small electric lamps lighted by batteries placed in the stock of the gun. The sections lview in the accompanying out above how the lamps are arranged. The sights are formed with priman, which at their lower ends communicate with chambers in which the lamps are located. The lamps are it only made to the lamps are located. The lamps are it only not become to the lamps are located. The simple are it in the lamps are located. The lamps are it in only most because for the section of the enemy for the sector, to expose his whereabouts until he is ready to five. The sights are of such a nature data they may be used in the daying with the lamps disconnected, a switch being provided for opening or closing the lamp circuit.

re Control in the National For (Concluded from page 421)
way during the fire season, while the

work of clearing the strips in a satisfac-tory manner, including the disposition of all refuse, is to be done by the rail-roads but under the supervision of the Forest Service

One of the most potent reasons this agreement is a good one is the fact that the courts have decided the right of the Department of Agriculture to damages from roads running through National Forests for fires which they cause, and this fact is a strong inducement for the roads to join with the department the effort to keep fires down

Another strong factor is the fact that the Northern Pacific, being a land grand road, owns considerable timber on the al ternate sections along its line The Great Northern, although it is not a land-grant road, also has property at stake in its buildings and the line itself whose opera-tion may be seriously interfered with by

tion may be settled, and the relation of the value of heavy timber in mountain our regions as a deterrent to avalanches, landalides, and floods is also to be con-From the standpoint of far sighted business policy a still broader argument is the relations of the forests to the general welfare of the regions whose traffic the roads handle. Timber which goes up in smoke pays no freight tolls and unchecked forest devastation means the enfeeblement of many industries de endent on wood and water

Practical Sterilization by Wrans of Ultra-Violet Have. sems to be little doubt accord

ing to The Lancet, that the germicids action of the ultra-violet rays will shortly be made available for the purposes of ble for the purposes of practical sterilization in what exact tain, but one view is that they produce came Whatever the nature of the ac-tion may be, it seems clear that their these rays, and special precautions have application for the purpose of sterilizing to be taken so as to bring it thoroughly under their influence articles intended for human consumption articles istanded for human consumption under their induces will allimitate the objection to the use of chemical antiseptics, the effect of which space the human organizer may be harardia. In an interesting super which has reached us on the Bierlins is due to the shattering of the coal when then of Waker by Means of Quarts, it is experted from the favor of the work Lamps, by Dr Max was Recklinghamens, in just be blast The current of all the control of the control of

if is stated that work on a very large this subject, and has developed the entire system of sterilization of different liquids used for alimentary purposes liquids used for alimentary purposes, based on the effect of the ultra-violet rays created in Cooper Hewlitt lamps made from transparent quarts. The chief work in this line has been done by Prof Heart in the Physiological Jaboratory of the Borbonne together with Dr. André Helbronner, who cooperated with Dr Max von Recklinghausen a view to developing an entire steriliz ing system of the type described. The preliminary work was done by studying the action of the ultraviolet rays on different types of microbes and the influence of the different wave lengths. Dr Roux of the Institut Pasteur in which a good many of the experiments were made presented to the Académie des Sciences resented to the Academic des Sciences ome of the work done by the above cited cientists Technically speaking the sults so far have been the development scientists results so far have been the development of a small water sterilizer for hospital use whereby 132 gallons of sterile water are produced per hour from ordinary city water by means of one Cooper Hewitt lamp type Blikas," absorbing three amperes at 110 volts. Within a heat time a voye large straighten quitted. short time a very large sterilizing outfit based on somewhat similar ideas will be running which will sterlize 1500 cubic feet of water per hour, this being large enough to treat the entire water supply of a town of about 10 000 inhabit The installation of the lamp it stated, is a matter of no difficulty hat is necessary being to connect up to the terminals provided in the dome of the apparatus and to make the justment peressary for the voltage of the particular circuit In order that supply of water delivered from the apparatus may be absolutely sterile of sterile to any required degree it is not wary that there should be means dealing with the various water pressures met with in different districts. To secomplish this purpose the inict pipe is fitted with an adjustable valve of special pattern which can be readily set, so that when full open the delivery from the apparatus does not exceed the quantity specified this in the case of requirements being for absolutely sierile water, being 112 gaillous per hour. The water enters the chamber formed by the outer rone with a swirling motion. At the top of this cone it overflows and finds an outlet at the bottom of the inner cone up which it rises and flows out at the dis-charge pipe. The swirling motion is charge pipe. The swirling motion is maintained during the complete passage of the water through the apparatus in order that it may be thoroughly stirred up and all microbes presented to itso of the light the water coming under its influence on two distinct occusions. Draining cocks are provided on the apparatus to emble it to be thoroughly emptied should circumstances arise whereby it would not be used for a considerable time Not only does this sys ten provide in the case of the apparatus under discussion a continuous supply of sterile water available within five min-utes, but the water or any other liquid that may be treated is unaffected as far as taste is concerped as it retains all as taste is concerned as it retains all natural gases and sails in solution. The work of Prof. Henri, Dr. Helbronner and Dr. Recklinghausen has also been directed towards the complete steriliza tion of milk, and this they have also accomplished. The apparatus for this accompnished. The apparatus for this purpose is more difficult to build than that for the treatment of water. Water is very transparent to ultra-violet rays. milk however is practically opaque to

which passes through every coal mine from one ventilating shaft to another carries the dust into every part of the galieries, which may extend for several miles. The distribution of the coal dust is further increased by the conveyance of coal in the mine cars, which usually move in a direction opposite to that of the air current, so that much dust is blown from farm. The dust settles in the corner and on the projections of the walls of he gallery, and especially on the floor and the tops of the timbers. If the mixture of air and suspended

If the mixture of air and suspended coal dust comes into contact with a suf-ficiently hot flame a combustible gas is suddenly generated from the coal dust this gas, known as methans, or marsh Ihis gas, known as methane, or marsh-gas is not explosive, except when it is mired with air, in which condition it explodes with fearful violence. The shock of the explosion scatters in the air much of the coal dust which has actited on the floor and elsewhere, and the heat produced by the explosion dis-tile from this, want which coal dust a tils from this suspended coal dust a fils from this suspended coal dust a fresh quantity of methane which comes into contact with the flame. In this manner the explosion is propagated from point to point, often throughout the entire mine

extensive explosions of coal dust are confined to preventing the dust from rising in the air, and to disposing of the heat produced by the initial explosion effectually that the further distillation of the coal dust and the formation of gas are prevented. The heat produce by the initial explosion may be consum by the initial explosion may be consumed in the evaporation of incombustible liquids, distributed through the workings. The greater the quantity of such volatile liquid, and the greater the exlings The greater the quantity of such volatile liquid, and the greater the ex-tent of surface exposed to the wave of explosion, the more rapid and effectual is the absorption of heat. The liquid used for this purpose at present is water It is necessary to wet or sprinkle every part of the mine in which coal dust exists This precaution is enforced by law in Germany and Austria but not elsewhere even in England, America, or France Most of the water applied to vertical surfaces quickly runs off, and the little that remains adhering to the surface evaporates in a few hours. The effect persists a little longer on the floor of the gallery and other horizontal sufaces, but even the paste of coal dust and water that is formed on the floor and water that is formed on the floor soon becomes dry Hence the application of water must be frequently repeated Too frequent watering however, is injurious to the operation of the mine water soaks into the porous rock loosens it, causing danger of cav and In very hot mines, the rapid evap-tion of the water produces an exceedingly damp atmosphere, which very injurious to the efficiency and health of the miners The Krusko

The Kruskopf process for the prevention of coaldust explosions, which has recently been patented in Germany, em-ploys instead of water a viscous pasts, of such chemical constitution that it does not evaporate appreciably under the in fluence of the normal air current, but littenee of the hormal air current, but evaporates rapidly when exposed to the host of a small explosion. Owing to the adhesive character of the paste, it can be applied to all surfaces horizontal vertical and inclined and in about eight times the quantity which is possible in the case of water. The thick paste, fur thermore, does not soak into the rock and as it does not evaporate in ordinary conditions it does not increase the humildity of the atmosphere. It has been proved by experiment that a coal dust explosion which in its nature is proexplosion which in its nature is pro-gressive, can be arrested by applying this mixture to the first hundred yards of the gallery this distance being sum cient to cause the explosion to die out owing to lack of explosive material the actual conditions of mining the original ignition of coal dust takes place in almost every case, at the face of the (Concluded on page 429)

In important tests or races, where absolute accuracy is necessary, the Warner Auto-Meter is the only speed-indicat-ing device considered

On the cars of quality everywhere—the cars of experienced motorists—the Warner Auto-Meter occupies the place

These men know that a speed-indicator must be accurate and reliable under all service conditions or it is worthless. They know—often from seperence—that this accuracy and reliability are found only in the Warner Auto-Meter—the aristocrat of speed-indicators.

You can get speed-indicating devices for almost any price you want to pay-but what's the use?

Cassified Advertisements working, and the explosion is proposed. It is not to the control of the possible to confine the explosions to the workings themselves and to protect the rest of the mine, without the nocessity of applying the same precaution through miles of galleries. This fact greatly re-duces the expense and trouble involved in the method. Practical experiments in a Westphalian mine and in in a Westphalian mine and in an ex-perimental gallery have proved the cor-rectness of the theory upon which this process is based. In the mine, the walls runnined damp \$1,000 hours after the application of the paste, but they dried up within six hours whom water was used. The explosion of it grains of dynamics produced as an interior of coal-cient and air whom, he walls on the rail. dust and air when the walls of the gal lery are dry, and for this reason the us isry are dry, and for this reason the use of dynamite in coal minos is probabilited by law. The experiments prove that in a mine gallery protected by the Krus-kopf process, more than five ounces of dynamite can be exploded in a mixture of coal gas and air without causing ignition. The experiment was repeated twelve times. After each blast, the tweive times. After each blast, the quantity of coal dust in the mixture was increased by the addition of a fixed amount of dry dust, but the application of the paste or water was not renewed in these conditions, when water was

## curred after the twelfth blast when the Kruskopf paste was employed. These conditions are very much more unfa-vorable than those which occur in the Colors of Foods.

practical operation of coal mine

used, ignition took place after the third blast, but the first faint explosion oc

Of the strong addiction many consum-ers have for the use of foodstuffs that are secretly and highly colored for the market, the London Lancet says "For some not quite clear reason there are many people who look upon the brown egg as necessarily a new laid one, brown ogg as necessarily a now into one, and hence a fair demand for brown eggs has arisen, which is easily mot not by the honest brown egg, but by the white egg which has been steeped in a dye which renders it visually indistinguish which renders it visually indistinguish able from the real article Again, when milk happens to be of a buff tinge, it is milk of course nothing can be easier than to astisfy this preference for a milk of a course nothing can be easier than to astisfy this preference for a milk of a course of the milk of the milk better is disliked as looking too much like dripping. The remerly is simple, it is actually colored vegatables must be consumer of them being quite willthe consumers of them being quite will-ing to ignore the fact that copper does not make them fresh or wholesome On the other hand, curiously enough, bread

the other hand, curiously enough, bread must be white.

"It is, of course, perfectly natural to take color as a criterion of the dietetic value or flavor of food, and the attracvalue or navor or food, and the attrac-tive or unattractive appearance of food may make all the difference as to whether that food is, or is not, assimilated prop-erly The deceit which is practiced by artificially coloring food may thus serve at useful purpose, so long as the coloring matter is harmess, but as a rule the proceeding is an immoral one. It does not follow that because food is unat-tractive its value as a food is sit, while every form of sophistication is open to commercial abuse. A correspondent last week submitted to us a brown-shelled egg which on opening displayed a gor-geous red coloring scattered chiefly through the white On analysis The supply the shiften of a family is massive of the supply the shift of an analysis the largery fig. 1 and 1 an

## The Always-on-Duty Telephone

Your Bell Telephone is on duty 1440 minutes every day. So is the telephone exchange; so are the toll lines which radiate through the neighboring communities; so are the long distance lines which connect you with far-away cities and other radiating systems.

The whole Bell System is on duty 1440 minutes a day-and if any of these minutes are not used, their earning power is irrevocably lost.

Like the Police Force or the Like the Police Force or the Fure Department, the telephone is not always working—but it is always on duty and always costing money. But you would not be satisfied with the fire department if your burning house had to take its turn; nor with the solice force it would with the solice force it would be to the control of the control of the with the solice force it would be to the control of the control of the with the solice force it would be to the control of the control of the with the solice force it would be to the control of the control of the to the control of the control of the to the control of th with the police force if you had to wait in line to receive protection

You want service at once. That is exactly what the Bell System endeavors to give you immediate attention, instantaneous service It strives to be always ready to receive your call at any point, and connect you with any other pointwithout postponement or delay.

It would be much cheaper if telephone customers would be content to stand in line, or if their communications could be piled up to be sent during slack hours; or if the demand was so distributed as to keep the whole system comfortably busy for 1440 consecutive minutes a day.

But the public needs immediate and universal service and the Bell System meets the public's requirements.

## OUR WATIOWAL GOOD ROADS LABORATORY

ONG the less known, but by no means less important, sections of the broad field of activ ity covered by the Department of Agriculture, is that which comes under the Office Hoads Although this office has no adminis trative duties and exercises no control over the re of the United Status - except of course, those that are located on government reservations—it is doing most important work of a scientific and ducational char

The movement for Federal assistance in the promotion of good roads dates hack to the year 1893, when a modest appropriation of \$10,000 was inche, to enable the Secretary of Agriculture to inaugurate the work To date a sum of nearly half a million dollars has been appropriated, and if this year's estimate be in-cluded the total reaches about six hundred thousand dollars

A full account of the growth of this moven presented on another page of this issue and it gi presented on another page of this issue and it gives us much pleasure to draw particular attention to that branch of the Office of Public Roads which is known as the Division of Tests. We make this special refer-ence on account of the high character of its organization and work, and because one of our recent editorials would give the impression that no such divi-sion exists. As a matter of fact this laboratory as infurmed by Director A W Page, is not only equipped with the last and most improved apparat quipped with the user and most improved apparatus used in Kuropean laboratories but has developed a number of additional tests, such as those for tough-ness and e-menting value. Houtine tests are made on road building materials free of charge for any citizen read unitining insterling tree of charge for any center of the United States and a large amount of experi-mental and research work is being carried on in-deed it is justifiable to state that the laboratory of the Office of Public Roads is the most completely equipped road material laboratory in the world and that the number of samples tested venry is far greater than in any similar institution. As a matter of fact, many summer institution. As a matter of fact, during the present year about three hundred typical samples of the rosed building rocks of England Scot land and Wales were tested by special request in addition to the regular routins work.

### ARBITRATION VERSUS SELF REDRESS.

S surely as the due! has given place, as individuals to the court of justice, will the awful arbitrament of war give way to the international tribunal, also as a corollary international tribunal, sisc as a corollary to this it may be written down that as the court of justice has back of it for the inforcement of its decrees the publish machiners of the government so will the international court be backed by some form of international police composed of limited mass sud military forces, in which each of the signstories to

the international court will be represented.

One of the brightest angurles of the dawn of a world wide peace is to be found in the fact that it has the fashion, during the past year or two, to speak of armies and navies as means for the preserva-tion of peace. When the leaders of the world, he they presidents kings or emperors, declars that every in crease in the armed strength of their respective cour tries is undertaken for the express purpose of preserving peace the statement is generally accepted as sincere. Although the advocates of peace by arbitration deplore the enormous investment of tressure time, and labor involved in the maintenance of the vast military organizations of the civilized world they are beginning to believe that the advocates of peace by war are as anxious as they thouselves that the world's neace he permanently preserved

The establishment of the noble principle of inter-national arbitration will be, after all, merely a repe-tition in the international world of a process of evolution from berbarism to civilisation, which has long ago taken place in the individual national world. Far back in the beginnings of human history, the princi-ple of self-redress was paramount. If wrong or fancied wrong was done, the injured party encompassed the death of his enemy by such ready means as might be at hand Gradually, with the growth of intelli-gence, it was realised, not only that the injured party was but a poor judge of his own cause, but that the principle of self-redross was subversive of the peace and happiness of the community. It was realized, also, that the man whose brain was clouded with the smoke of furious passion, was not so well quality judge as some third and disinterested party, who could junge as some totro and disinterested parry, who could look upon the case in dispute with an impartial eye, and so, gradually but surely, the principle of arbitra-tion took shape and became the stable rock on which iderful modern system of national jurispru dence has been erected
We have before us a lucid revi

the principle of national arbitration in a pamphlet published by the Maryland Poace Society and written by lames Brown Scott lecturer on international law in the George Washington and Johns Hopkins universities. He refers to the three stages which were shown in the development of the celebrated Roman judicial system which were as follows (1) The pri-vate illigant submitted his controversy to an arbiter of his own choice for decision according to the con science of a good and imparing man (2) the magis trate or judge chosen from an official list or par is preferred to a citizen arbitrator, (3) the admin tration of justice is regarded as the duty and there fore the right of the State and a judicial system is prepared for and imposed upon the citizen

The author of the paper sees the same unconscious

development taking place in the gradual growth development taking piace in one growns arbitration between states. In early times they would choose as arbitra the Pope, in modern times, some foreign sovereign. The lack of continuity of desome foreign sovereign. The lack of continuity of de-cision in this system, which desit with the individual case, led up to the second stage, during from the first conference, which involved the appointment by inter-national action of a ponel of judges, from which judges forming the temporary tribunal are cheese. "We stand," says the writer, "upon the very threshold of the third and final development when nations as a whole determine that international justice is the province of the international community and cousti-tute a court of international justice to which litigant states may resort in conflicts of importance ' much has been done. The organization, jurisdiction and procedure of this international tribunal have been determined Now, we mercily await the appointment of judges to establish a world wide court, in which the nations may obtain justice as easily and readily as private suitors in national courts of justice

The author of this paper does not go into the ques-on of the enforcement of the findings of international arbitration It is our belief that an international arourt should be backed by an army composed of drafts from the various armies of the world previous to their disarmanent limited in numbers and exist ing solely for the enforcement of its decrees

BIR WILLIAM BESSELS AND HIS WORK 7 TH the death of Sir William Huggins there passed away an astronomer whose pioneer work in the field of astro-physics pioner work in the nead of matro-physics the history of arience it was largely due to Sir Williams gentus that the spectroscope became an instrument of astronomical investigation hardly less important than the telescope. His work was done so many years ago, and its results have been so farreaching, that it is easy enough to value it at its true

Huggins began his studies shortly after Kirchoff applied the terrestrial science of spectrum analysis to the study of the sun Parity as a result of Huggins's efforts astronomers have been enable to obthe solar prominences at any time, with waiting for an eclipse, for the principle of spec waiting for an eclipse, for the spinciple of spectra-copic visibility of prominence lines at the edge of an uncellipsed aun was quite explicitly stated by him in February 1888 He even derived various instruments for bringing the prominences into actual view His use of the 'open allt' on February 18th, 1869, may be said to have begun the modern study of noise promi-mences. Helors the days of the 'open allt.' promi-nences had been examined only in sections.

The first investigation of more.

The first tangible results in the estimation of move The first taugible results in the estimation of move-ments of approach and receasion between the earth and the stars, by means of Doppier's principle, were communicated by Sir William Huggins to the Royal Society on April 23rd, 1888. Application of this method to the stars is encompassed with difficulties; for it needs a powerful dispersive spectroscope to show a minute line of displacement, and powerful dispersion involves a strictly properfiguate enter of light. Helecting the brightest star in the as the most premising subject of experiment, considered the F line in the spectrum of Stri just so much displaced toward the red as to indi-recession at the rate of 25 miles a second. The indias resumed by Huggins with improved app was resumed by Huggins with improved apparatus the following year, when the velocities of thirty a were approximately determined. The scope of William Huggins's achievement was not, however russem ruggmes achievement was not, however, detect the motion in the line of sight so much as retablish the method of precuring data. His sugh has been of incalculable value, so much so, that spectroscopic investigations of steller movements in confidently be expected to play a leading part is unraveling of the vast and complex relations of even now we dimly detect among the stars.

Mary all parts

even now we comput getest among the stars.

The first successful application of the spectra
to comets was made by Donati in 1864. Come
previously been considered to shine mainly, is
wholly, by reflected soulight. They were not
ceived to be self-luminous and to be formed, to a gowing gas. These represents to a small see nature of the sature of the gas, a problem first atty of sir William Huggins in 1888 Winnecke's conference of the sature of the sature of the sature of the sature of the first revealed the typical hydrocarbon specific with which we are now familiar Tebubtte close (context III, 1881) was the first context of which we have the sature of which Huggins was completely successful That achievement threw open to investigation a part of the cometary spectrum invisible to the eye, so as to allow

an additional test of cometary constitution
In the field of stellar spectroscopy Huggins s work by Lewis M Rutherfurd in New York gins may well be considered as one of the fathers of stellar spectroscopy. When he brought to a successful gins may wen or commercial as statements in spectroscopic culmination his early experiments in spectroscopic photography, we really began to learn something of romposition of the fixed stars On December 18 1879, he was able to communicate to the Royal So

ricity results answering to his expectations

The dry-plate process, with which such wonderful The dryphate process, with which such wonderly results have been obtained in astronomical photogra-phy, appears to have been first made available by Sie William Huggins in photographing the spectrum of Vegs in 1866. That work laid the foundation for the brilliant application of photography to astronomy by Common, Draper, Janusen Rutherfurd, and later

fronomers

A intrly complete preliminary answer to the ques-tion, 'What are the stars made of " was given by Sir William Huggins in 1864 By laboriously comparing stellar dark lines and the bright rays by terrestrial substances he sought to verify his conclusions regardless of cost in time and trouble Al-though he himself averred that the full investigation of s single star spectrum would be the work of years. be was able to furnish however detailed and ac mmte

drawings of the spectra of Betelgeux and Aldebaran Before Huggins applied the spectroscope to the study of nebulse, it was felt that these mysterious, filmy objects of light would forever thwart the astron cojects of light would lorsery tawart the automotive Each one and more powerful (elecacope that made its appearance had resolved into clusters stars which previously had appeared to the naked eye as single orbs it was felt that those filmy stars which had resisted all attempts at telescopic resolution might be similar clusters, for which reason some doubt was cast upon Herschel's theory that they were masses of shining fluid

pust 29th, 1864, Bir William Huggins sifted through his prisms the rays of a bright planetary nebule in Draco. To his infinite surprise, they proved to be of one color mainly and thereby proclaimed their Thus Herschel's conjecture liffused at large throughout the c gaseous nature Thus Herschel's conjecture of a "shining fluid 'diffused at large throughout the cosmos was unexpectedly revilled. By 1868 Huggias had sep-arately examined the spectra of about seventy nebula, of which one-third displayed gaseous characteristics. of which one-third displayed gaseous characteristics. All of these gave the green ray frudamental to be nebular spectrum and emanating from an unknown form of matter ansued by Raggista. "subnium." A successful beginning in subniar spectrography was made by fit william Ruggists of March 116, 138. Five lines in all stamped themselves upon a plate, exposed to the tary of the sebula in Orlon. The was photraphy definitely made the service of the readout.

nabulas
The effect of Huggina's work has been to remore that astronome; from the expedence of the telescope, to substitute for the retina the more sensitive photheristical point estimate the statement of the immensional plate, and to teach the astronome; the immensional plate value of the spectreeope in assistying the compension of attra which is the telescope appear is more point, or the property of the proper

### ELECTRICITY.

By ming a sectionsope and a sensitive telephone relay, the heart beams of a patient in London were transmitted to the home of John Milne, the noted sestemologist, on the Isla of Wight. The heart throbe were heard by four physicians over an ordinary telephone, and so clear, was the transmission that it was possible to diagnose the heart troubles It is expected that this use of the stethoscope with a telephone relay will enable physicians to keep in better touch with their patients.

An electrical thermometer which is very sensitive to slight fluctuations of temperature, has recently been put out by a German company for medical use, to determine the degrees of fever it consists of a to determine the degrees of fever it consists of a coil of platinum wire inclosed in a quartz glass tube. through which a current is passed from a four-voit storage battery The tube is placed in the armpit of the patient, and a milli voltmeter indicates varia or the patient, and a milit volumeter indicates varia-tions is, the resistance of the coil, due to the heat of the body. The milli-voltmeter traces a tempera-ture curve on a band of paper, and in this way it is possible to study the action of drugs on the patient.

According to a recent press report, steamships of the French trans-Atlantic line are using the apparthe press trans-atomic fine are using the appearatus invented by Signors Bellini and Tool of the Italian navy, by which wireless messages may be transmitted in and received from, any desired direction. The particular advantage of this appearatus on abphosoris is the fact that it enables the operator to determine from what direction a signal is coming. actermine from what direction a signal is coming, and the course of the vessel can be governed accordingly. Recently the "Provence" crossed the Atlantic, equipped with this apparatus, and was ab'e to determine the positions of various vessels passing in the vicinity. The danger of collision was thus entirely

An interesting paper on insulating materials for wireless talegraphy was read recently before a meeting of the Wireless institute in this city by Mr Stanley M. Hills. He pointed out that rubber is not perent, but apt to deteriorate, that marble is hydroscopic and not to be relied upon because of its irregu scople and not to be reliefd upon because of its irregu-lar composition, that percelain is age to contain hid den defects, and that glass, while the defects it con-tains may be descried visually and thus avoided, is extremely fregile. He spoke of mice and of wood as good insulators if kept dry, and dry of it as good insulator for the reason that it is liquid and "self-healing." Dry tim makes an excellent insulator, and for high voltages, compressed air may be used

The advantages of an electrical shovel over a steam shovel have recently been portrayed, showing that wherever electricity is available at moderate rates. waserver electricity is available at moderate rates, the electric shoved is much to be preferred One of the great objections to the steam shoved is the fact-that the expenses of a fireman must be paid, and the fuel, as well as the water, have frequently to be carted for a very long distance. Steam must be kent carros ror a very long distance. Steam must be kept up continuously, despite all delays in operating the shovel, while for the electric shovel the same argu-ments apply as are made in behalf of electric drivein machine shops, namely, that when the shovel is idle there is no consumption of power, yet the power is ready for instant use whenever it is needed

An interesting discussion by Dr Charles P Steinmets on the magnetic properties of materials was published in a recent number of the Electrical World published in a recent number of the Electrical World It was stated once years ago that magnetic alloys could be made by combining non-magnetic materials of Reinness points to the fact that is all the threat alloys manganees is used, and that this is slightly erro-magnetic One of the simplest of these alloys cobasts is combining one part of manganees with three parts of autimony, the miture being made by powdering the metals and than beating them in a text than. The result is a black power which is aroundy alloy has been found which does not contain some of the ferro-magnetic group—liven, cobalt, lockel, manganees, and chromitum the part of the companion of the

Now that air craft have been entered as war ves sels, inventors are beginning to cast about for some effective means of destroying them. Recently an effective means of destroying them. Recently as serial torpedo bas been invented, which, by means of a Heristan wave controlling system, may be directed from a distance without carrying any oper ator. This dospedo was exhibited at the London Hippodrone, where the inventor caused it to traval out over the audience, starting it wherever be chose by pressing buttons on a switchboard on the stage The torpedo is provided with two screws, which may be operated independently to steer the ship laterally. while a horizontal rudder serves to steer the vess white a horizontal rudder serves to stear the vessel vertically. The device may also be equipped with suppositives, to be dropped on the enemy when the beryselo has been maneuvered to the right position This, were formasserated at the Hippodrome by releasing fiftyers, on the audition.

### SCIENCE.

Beward B. Gerriott, chief forecaster of the United States Weather Bureau, died recently at Washington at the age of 57 He had been connected with the ther Bureau practically sinds its establishment, which means for forty years

After thirty months' cruising in Philippine waters, the Fish and Game Commissions steamer Alba rosa," Commander C M McCornick, United States Navy, entered the Golden Gate, San Francisco and dropped anchor The "Albatrosa" has been engaged in a thorough examination of the fish in Philippine

When one solid body gildes over the surface of an other, the coefficient of friction diminishes as the ve-locity increases and nearly vanishes when the velocity attains a certain critical value. This diminution of friction is due to the air which partially sepa rates the two bodies at low relative velocities em completely at the critical and all separates them higher velocities.

Dr Douglas Mawson, who accompanied Sir Ernest Shackleton on his last Antarctic expedition, arrived recently in this country, bound for Sydney New South Wales, to resume his duties as lecturer on geology in Sydney University Dr Mawson reiterated the state-ments already made by Sir Ernest Shackleton that there is an immense stream of coal within 300 miles from the South Pole

An interesting method for measuring the transpar ency of developed photographic plates has been de-vised by Dr L. H. Friedburg. A polarized light appa ratus is employed. An opeque plate not rotating the plane of polarization, when interposed between two parallel mounted tourmaline plates cut parallel to eir optical axes, will reduce the angle of 90 deg between extreme brightness and maximum darkness by an amount proportional to the density of the sil-

The emission spectra produced by certain elements heated in quartz tubes to 2 500 deg F have recently been studied. It is found that in these circumstances sulphur produces a blue light and a nearly ous spectrum Selenium gives a pale yellow light with bands, which are generally well defined, but be come uncortain toward the red end Tellurium emits green light and its spectrum contains nur ands which are also hazy toward the red end Phos phorus and arsenic give a white light and continuous spectra, while antimony produces a nearly continuous spectrum, crossed by very ill-defined bands

The distinguished German chemist Ostwald has taken out a German patent for the improvement of drawing inks and water colors. He has found that by addition of small quantities (from 1 1,000) of volatile organic compounds of the aliphatic series, which are soluble in water, at least to a small extent and contain not less than four atoms of carbon inks, drawing inks and other water colors a rendered capable of readily marking such surfaces as parchment lyory, waxed paper etc. In the case of neutral liquids, an alcohol, ester, or other neutral sub stance is used, while to acid inks, free fatty acids, such as valeric or caprok acid may be added

How bright is the sun? No two authorities agree Another estimate has recently been made by C Norce mann. The effective temperature determined with his pyrometer was found to be about 5 320 deg absolute Now, the brightness of an incandescent body emitting white light varies sensibly as a function of the tem-perature, and this law has been verified by compart son with numerous terrestrial light sources. Taking into ronsideration the absorption of the solar atmosphere, the effective temperature of the photosphere is probably about 6,450 deg absolute. The correspond ing brightness of the mean effective layer is then about 219 000 decimal candles per square contimeter The solar surface is thus considered to behave very a black body, and to have an emissive power nearly unity

Ducellies has made a study of the chemical char acter of various alloys of cobalt with tin, antibismuth, lead, and copper, by measuring the dif-ference of potential between each alloy and each of its constituents, when immersed in a solution of cobalt sulphate The results are expressed in graphical form. The curve of the cobalt-tin alloys shows a distinct inflection at the percentage of 66.76 of tin, which corresponds to the compound CoSn The cobaltantimony curve indicates the existence of two definite compounds, CoBb and CoBb. The cobalt bismuth al lovs also show two distinct compounds. The electro motive force produced by most of these alloys is very small. The curves show that in the separation of the two metals by the process of solution, the cobait results outlissed to practically pure condition, while the solution of bismuth contains about 5 per cent of coheir. The behavior of the coheir ded alloys is similar to that of the alloys of coheir and bismuth.

tion with a chronographic apparatus, but with a chronographic apparatus, but stated to the state of the state

nemes the record tables the form of Phys. Scholars of the Comment of the Section of the Section

The influence exerted by superposed surfaces of

such other is very great. In some cases the resinance is smaller for a group of surfaces than for a single surface. For surfaces inclined to the direction of the wind, SEES formulated in 1905 the following law vind, SEES formulated in 1905 the following law vind, seemed to the horizon varying between 0 and 10 degrees, the pressure is proportional to the andiyellow for isolinations greater than 30 degrees, the resistance is constant.

In order to extend these observations (which have

Pig. 8.—The Riffel accodynamic balance placed above the experiment room-

been fully described in the SCENTIFIC AUGUSTA'S Ellifconstructed in 100 an serodynamic laboratory at to constructed in 100 an serodynamic laboratory at to ducked experiments with fixed surfaces, expends to air currents produced by a blower of 50 kilowatic power. By this method be was able not only to obtain the resultant pressure, but to determine the distribution of pressures no both sides of the surfaces and the move-

of pressure on both sides or the surrace and the morement of the sir his twiching.

In order to place the surrace in conditions as nearly.

In order to place the surrace in conditions as nearly.

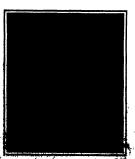

In order to place the surrace in conditions as nearly.

In order to place the surrace in conditions as nearly with order to the surrace in the content of the current must have so large a cross section that its eatering mines that the surrace in the surrace. The pressures experienced by the surrace measured by an aerodynamic balance, by which it is possible to determine the horizontal and vertical components, as well as the content of pressure, data which are very important in the construction of surrounds and extended to the red C, which is placed that the surrounds a link-in current. This rod is attached to a right T-shaped frame DB, which is expailed of motion around a kink-inge A. The action of the air current is opposed by popular the surround of the color of the air current is opposed by popular the surround a kink-inge A. The action of the air current is opposed by an upward poil at f produced by the weight P, in the balance above When equilibrium is established the moment of the forces which tend to move the experimental surface and its support round the knifte ofget, each to computed from the weight in the scale pass Two weightings are made, when the scale pass Two weightings are made, when the scale pass Two weightings are made, when the first reat reat and when it is in motion at known velocity. The moment produced by the air current is the difference of the two results. The other end of the

wo results. The other end of the rod E carries a second knife edge B, which is directed upward and which can be brought to bear against its seat by shortening the against its seat by shortening the of H, by means of the eccentric G. In this way the moment of the air pressure around B can be measured. Thus it is possible to measure the moments of the pressure. with respect to two points, further more, as the rod C can be rotated about its axis, the elements of the resultant pressure upon an inclined surface can be determined by mak ing four measurements, at asi muths differing by a right angle. The vertical part D is a rod of cast steel, which is capable of slight motion in a sheath attached to the floor of the room above, on which the balance stands. This sheath which is very narrow and is be a the vertical rod from the air our rent, without appreciably affecting is provided with a pair of knife edges at each ond The knife edges at the front or windward end 4 are directed downward and back ward, while those of the other end are directed upward and b

ward. The seats on three kaife edges have projections, which prevent the kuife edges from moving along the grooves in which they turn. By moving a lover, the life edges in frost each billited from their seats to protect the control of the life of the life edges. In the life edges in the life edges of the beaute, could be moved by means of kuife edges. In abort all the moving parts of the apparatus turn on kuife edges, and the friction is newlightly. The T-shaped piece 17th weight so moved the life edges and the friction is newlightly. The T-shaped piece 17th weight is not an entire and damping the secondary oscillations, due to mail variations in the force of the air currents and by making the equilibrium of the shr currents and by making the equilibrium of the balance stable in every relative position of the current and the surface. The entire apparatus is supported by a measure wooden patterns, about 8 feet again.

The current of air is drawn through a tube 64, feet in diameter, and every prevaulton is taken to keep its strength uniform during the experiment. The air is drawn from a large closed room in which the surface

Tige 6.- Regultinett room of Miller's nevelying

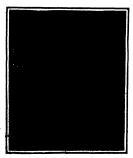

Fig. 7.—The inlet of the blower.

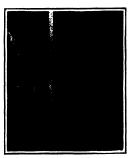

Fig. 8 —Arrangement of apparatus for measuring pressures at various points of the surface.

is placed near the inlet of the blower, and not at its outlet, as is usually done. The air which leaves a blower is subjected to irregular disturbances, which cannot be overcome sufficiently to produce uniform and constant velocity over the entire surface. The and constant velocity over the entire surface. The pressure secreted upon the surface is transmitted to the balance in the room above, where the observer is stationed. The sile renters the experiment room through a reliular disphragm in parallel filaments. At the opposite end of the room is the mouth of the conduit which leads to the blower and which contains two ironwhich leads to the blower and which contains two irou-wire grattings of 2/6 inch mesh, placed about 40 inches apart which almost completty eliminate all irregu-larities of flow The air leaves the blower through a conduit which gradually enlarges and serves still furconduit whith grantary states were the velocity and direction of the air current are uniform through out its whole section and, as the apparatus is entirely included, it is not affected by the wind outside

The velocities of the air current are deduced from the readings of manometers, and the results have been verified in the following manner One of the sur faces exposed to the current was perforated with a targe number of holes, in

each of which was countersonk a screw, having at its center an orifice 1/50 inch in diameter By measuring with a small manometer the pressure produced behind each of orifices, and integrating the result, the had been indicated by the balance was obtained

We cannot here relate in detail all the interest ing results which Eiffel and his assistant Léon Rith have already obtained in this laboratory We will mention only a few of the more important

Eiffel has proved that ne value of the horizon tal component, or resist ance to the advance of an aeropiane, increases con tinually with the inclina tion of the surface to the horizon, while the vertical ent attuins a maxi mum at an inclination of 15 degrees, and thereafter diminishes very rapidly, and vanishes at 90 degrees, i e , when the plane is ver

The surfaces employed in these experiments had a plane of symmetry paral lel to the wind. In order to determine the as of the air filaments in this plane, a short and very light wire, attached to the end of a thin rod, was placed at various points of the plane, and the position and direction of the wire were deter mined as accurately as mined as accurately as possible in most cases it was found that especially near the front edge of the surface the direction of the wire fluctuated rapidly

between two fixed limits This fluctuation in the direction of the wire is due to the fact that at any instant the air flows according to a definite, but not very stable, system so that only a very small influ very stants, system so that only a very small influ-ence is required to pass from one system to another. The various possible systems of flow could be approxi-mately determined by careful observation and com-

matery determined by careful observation and com-parison of the directions of the wire Fig. 3 shows the directions of the air 5.aments near a square surface, the plane of which makes an angle of 40 degrees with the direction of the current Fig. 4 shows the directions of the stream lines near a surface inclined 80 degrees to the current. It will be ob sace inclined so usgress to the current. It will so so-served that these lines are very variable and conse-quently very instable. The same fact is shown when the surface is perpendicular to the current. Fig. 5 shows the average direction of the air at various points in this case. In the two regions inclosed by points in this case in the two regions inclosed by the dotted lines, the disturbance is so great that no mean direction of flow could be determined In regard to the center of pressure, this coincides

with the center of figures if the surface is horisontal

to 15 degrees, and thesee receies as the instinction is increased, and again attains the center of figure when the surface becomes perpendicular to the extract Pinaity, Biffel indorses the almost universe preference of aviators for curved sustaining surface preservence or aviators for curved sustaining surfaced and proves that, for a given resistance to forward movement, the curved surface always develops a greater litting power than the plane surface, septi-cially at small inclinations.

### The Transit of Malley's Comet

The Transit of Malley's Counts in the expected immersion of the earth in the tall of that historic body have proven once more what may happen to the best-laid plans of mathematicians. The transit undoubtedly occurred, but whether or not the earth really encou occurred, but whether or not the earth result encountered the tail seems to be a matter of considerable doubt. When the night of May 18th came, and the aclenities world was all ago, the tail was an curred that the passage of the earth through it seemed only remotely possible On the morning of the 10th a bread hand of light that stretched along the horizon for a distance varying from 15 to 150 daynes profess of the control of the control

This was more or less separated in 1883 a transit occurred which was fortunately

observed by Mr Finlag at the Capo of Good Hops The comet of 1882 was followed by him "continu-ously right into the boll-ing of the limb," No soonor the himb." No soes-or had it touched it, than it vanished as if de-stroyed So sudden was the disappearance that the comet was at first belleved to have passed be-hind the sun. As a mat-ter of fart, the observers at the Cape had witnessed a genuine transit The experience of the observers at the Hawaiian Isi ands with Halley's comet seems to have been exactly similar On the whole this apparent failure to observe the creeping of a black speck across the face of the sun may be deemedaronfirmation of our present theories that the bulk of a comet is much too filmsy to be detected in the blinding glare of our central luminary

Although the passage of earth through the tail of Halley's comet turned cut to be an extraordin ary disappointment, it is unfair to charge mathematical astronome with incompetence A comet's tall to so capriclous, so fluctuating a structure, it changes with such startling rapidity, that the predictions of any astronomer with regard to its behavior must al-

The tail of Halley's comet has conducted itself in a most whimsical fashion In the middle of February, it was some fif teen million miles long In April, it seemed have vanished entirely.

## Scientific American

NOW CRICAGO IS SOLVING ITS NAPID TRANSFET AT D. H. OTHER

The city of Chicago has been hard at work rehabilitating its surface street-for ayatens, and completing
plans for the new subway lines. The engineers of the
city have cetimated how many passengers cuter and
leave Chicago's six square miles of business area
swary twenty-four hours, and the results prove that
he present lines are hopelessly overworked During
two normal business days of the past year it was found
that on all of the lines running into the down town
district bounded by Chicago Avenue on the north,
by Tweiths Street on the south, of the betty Plaisurface of the control of the control of the control
area of about at aquare miles, avery asventh passenger was without a seat. When it is remembered that
the service cannot be improved much along present
lines, it is clearly seen that a subway is importantly
At a conservative estimate, the next generation will
see a demand for train facilities from the central ditrict of the city qual to all facilities now available
from the central part of New Tork city, with all it from the central part of New York city, with all its ferries, tunnels, subways, bridge and surface lines. To most this need the engineers have planned a sysh it is believed will adequately meet this

great demand for cars during the rush hours

The complete-system will be bounded on the north by Chicago Avenue, on the south by Twenty-second Street, on the west by Halsted Street, and on the east by Wa-bash Avenue Four terminal stations will be built imcountries of this subway sone, one at Chicago Avenue and North Franklin Street, one at Dearborn and Twenty-second Streets, another at Van Buren and Haisted Streets, and the fourth at Van Buren and rassicu perseus, and the south as Randolph and Halsted Streets. The new underground will begin where the four clevated lines now enter the district, and all surface cars from the respective quardistrict, and all surface cars from the respective quar-ters of the city will also converge at these four termi-nal stations, where all surface and elevated cars from the resident districts will become subway cars, and will remain under the surface until they again pass out of the district.

shown in the front page plan, a four-track route As shown in the front page plan, a four-track route will run close to the surface of Wabsh Avenue from Chicago Avenue to Twenty-second Street This route will carry all through cars from the South and North Sides, two tracks being exclusively for surface cars

Sides, two tracks being exclusively for surface cars and two for elevated trains. After passing to the opposite limit of the district, the trains from each direction will turn about and will return to their respective starting points by the same route From the West Side of the city two tubes will run in beneath Randolph and Washington Streets as shown in the accompaning plan, and will turn southward on State Street, and then return to the West Side under Adams Streets and Jackson Dioulevard After coming out into daylight at the Haisted Street terminal, these cars will also scatter to ail points on e west side of the river

To complete this first stage of plan one will cost To complete this new stage or plan one will coar-about forty millions of dollars. Its capacity will be fifty per cent greater than that of all the traction lines now operating within the district. With the aid of surface cars to make short hauls within the s district, this plan will serve the needs of the city for many years.

An additional expenditure of forty millions will An additional expenditure of forty millions will then build the second stage of this plan, when other busy streets will cover branches of the system. In this stage of the development will be found both loops and through routes for all parts of Chicago Yet where the various tunnels cross one another there will be no grade crossings one tube will dip in its course so as to pass completely under the other line. This will eliminate all danger of underground colli-

stons.

A further expenditure of thirty-two million dollars will serve to complete the system, when every street within the subway some will have beened it a proposed to subway. Two, three, and four-freck subway lines will homeoun the whole area, and the entire district will be served by the most substrate, set the plan, in its completed form, will cost about one hundred and twalve millions of dollars, and will serve he needs of the city at its present rate of growth until 1950 Improved methods of transportation will mobably cause the business district to expand, and until 1980 Improved methods or transportation will probably cause the bestness district to expand, and the subway will be built socordingly. It may ulti-mately be possible to remove every pract of rail and every car from the surface of down-fown streets. On our frunt page is shown a cross-section of one of the future stations on Wahash Avenue. As seen in this nation, the force of the force to the cross to the this nation.

or the future stations on Wahash Avenue. As seen it this potent, the tracks it close to the street surface because or the danger to certain building foundations, a lewiered subvey is impracticable, and the contestion by prohibitive. As the entire subvey is to lies for the contestion of the prohibitive as the entire subvey is to lies for the contestion of the contestion

and the engineers have worked out a type of con-struction to meet this requirement Stations of this type will be built in the center of every block on Wahash Avenne, and the platforms will be but a hort distance below the sidewalk level Underground walks will afford opportunity to cross the streets, or

walts will amore opportunity to cross the streets, or to walk parallel to the car line, past the basement windows of the department stores

The cars will include the most modern improvements, such as side entrances, to permit the rapid handling of passengers, provided with automatic signals, to the contract of the co handling of passengers, provided with automatic sig-mals to show the moloruzan when all the doors are closed. The use of these cars will greatly reduce the length of stops at stations. The plans also provide for the housing of all underground willities in suit-side chambers are street public service corporation will have its own chamber, as shown on the front-pass engraving, in which will be accommodated all of its pipe lines within the authway none "Particular care," when the provided in the commodate of the pipe lines within the authway none "Particular care," when the provided in the commodate of the pipe lines within the authway none "Particular care," very vital provision in the consideration of the fu are needs of the business district. These chambers will be easily accessible from the street surface, so that it will be a simple matter-to inspect or repair the pine lines of any company. The cost of this gal-lery construction has been included in the foregoing figures, so that an expenditure of one hundred and twelve millions of dollars will give Chicago a com-plete traction system, and the best possible provision for her public utilities.

This comprehensive plan is the outcome of seve months of investigation by City Engineer John Ericson The result is a scheme of construction that is well adapted to meet the peculiar needs of a city well adapted to meet the peculiar needs or a city that has its entire bushess interest within an area of six square miles. Whatever slight variations may be made in the plans during the progress of con-struction the scheme for construction as here de-scribed will be the general foundation for whatever subways may be built

## The Difference Setween a Sanitarium and a

The words "sanitarium" and "sanatorium" are popularly understood to have the same meaning and are generally used interchangeably, when designating (or describing) places of refuge for sick people but there is, in fact, quits a distinction between the meaning of

the two words. In answer to a correspondent on this subject the Literary Digas says
"The distinction between these words lies in the fact that they are derived from two different Latin roots. 'Sanatorium' is derived from the late Latin roots. Sanatorium' is derived from the late Latin sensaforius. meaning health giving The 'erm relates specially to 'an institution for treatment of disease or our of invalida, especially an establishment employing natural therapeutic agents or conditions peculiar to the locality, or some specific treatment, or treating particular diseases' On the other hand, 'annitarium' is derived from the Latin sensing from sensus meaning abole' or sound 'Sanitarium' relates more specifications. ly to 'a place where the hygienic conditions servative of health, as distinguished from one wi cally to 'a pla conditions are preservative of neatin, as dustinguished from one where therapeutic agencies are employed. Hence it is tis province of a 'sanitarium' to preserve health, that of a 'ananatorium' to restore it. Care should be exercised in combining the proper vowels in these two words in order to indicate correctly the derivation"

In our issue of May 14th we published an article on the utilization of wireless telegraphy in connec-tion with a Chalmers-Detroit automobile in the Glid den tour Through inadvertence, we neglected to state in the article that the wireless installation was devised by Dr Lee De Forest.

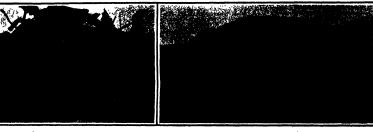

seconds The destructive motion was mainly vertical and began suddenly, that is, without the premonitory shorks which usually give most people time enough to run out from their houses. Immediately after the beavy up-and-down motion came a long series of smaller

titution and suffering are intense. Persons who wish to help may do so through the American legation in During the year 1909 small earthquakes in Cartago

During the year 1909 small earthquakes in Carago had been rather frequent, and the writer, who as seismograph in the Cartago College, began to send regular reports to the recently founded Strasburg Control Bureau of the International Association of Setsembers of the Property of the Property of the Sets of became alarmed, and spected in the streets and public parks tants and sheds, in which they stept. The

### NOW TO ACT IN CASE OF FIRE.

ST PERFORMANCE.

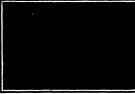

Perhaps no single ejaculation is capable of producing so instantaneous and so widespread an alarm as the cry of "Pire!" Nor is this surprising whon we remember that the fire fend is each year responsible for an almost incalculable loss, both of life and of

Yet of all emergencies, none more than an outbreak of fire imperatively demands a preservation of one's power to act with coolness and decision Often, by prompt and well-directed action, the threatened catas trophs may be averted, the loss of property and what is still more important, the loss of human life, may

Fire drill nowadays has its place in the routine of every well-conducted scholastic establishment, nor can it be doubted that the capacity for prompt and intelligent sction thus inculcated in the minds of intelligent action thus incurated in the raises of young people of both sexes has, ig emergency, proved the means of preventing squalling disaster. But while this capacity for combined action is very desirable, there seems to be a danger of fostering it at the expense of what one may term "fire aducation' Every child should be taught by means of precept tor's head, but the carbonic-acid gas with which the ater is charged belps to deaden the flames. How to act for one's safety, or to assist another,

in the case of burning clothing cannot be better told than in the words of Prof John Marshall He says "If the dress of a woman catches fire, she should at once lie down on the floor, and should crawl in this position either to a bell pull or a duor, and call for assistance, or she should roll herself in a rug or blanket in the event of a man rendering help he should at once lay the patient down take off his and roll her in it, unless he can obtain a blanket or rug or roll her on the carpet If a woman ronders assistance, she must be careful not to allow her own clothing to touch the victim, but to hold a rug or bianket in front of herself while approaching the fiames."

Prompt action without rashness or self-balking hurry, is the keynote of success in fighting the fire-field. This applies especially to those who wake from nend into applies especially to those who wast from sleep to find the house on fire. Not a moment should be lost, but there should be no wild rushing from a window to a door and back again. First an attempt should be made to get down the stairs. To excape through passages filled with suffecating smoke, tie a

shocks had nomewhat decreased in number and in-tensity when the fatal insue came. Cartago is situated at an altitude of 4,700 feet, at

the very foot of the huge volcane Iraru, which towers 11,500 feet above sea level. The Iraru volcane is considered as extinct, the only remnant of its former activity being a few famorolies or steam jets, located at a considerable distance from the new silent and cold craters. At no time before or after the catastroph have the frimarolles shown any symptom of increased activity Moreover, the seismograph in Cartago gave for most earthquakes a direction which was almost perpendicular to that of the volume. However, a few days betwee the destructive shock, the direction of the certification because variable, and for some of them coincided with that of the Franc. On May 4th the connoted with time or the frame. On May 481 the meetle of the apparatus logar writing the last chap-ter of the frame, and while so doing jumped out ser-ored times from the glass plate. Then the seismo-graph, which is a neary invaried peakelvien contained in a box some three feet high, was violently thrown against the wall; the given plate bill from its abelf,

ngazont and was; the gram pease full from its shelf, and was broken in two.

Among the public buildings which are in rules in the beautiful Palace of Fence, a gift of Mr Andréw Chrisquie The paints had but been completed, the inferious and, being loft unfaithful.

and experiment, what to do when a fire breaks out in his own house He should be instructed how to go to work coolly and methodically either to extinguish or—if necessary—to escape from the build one of this kind, imparted by practical meth thg Less ods, would become a source of strength in after life and would go far to chock the recurrence of fire out

breaks, with their entailed loss of life and capital Take, for example, the case of an overturned lump There is a sudden and alarming blaze, but if action is taken at once, the damage may be confined action is taken at once, the damage may be confined to the extree, legible or what not upon which the lamp actually like. To throw water on the confineration is useless. This burning oil will eithly be forced or a larger area. The aim should be to absorb the oil and mother the fames as much as possible, and this may best be done by means of some non-fammable preference as four, sand, earth from the garden

r snything of the kind Another point worth rem ing is the use of sode-water sypbon as an extinguisher Suppose that a lump or candle has ignited a curtain and that the finish has run up the fabric. A syphon of soda water held as abown in the accompanying photograph, and assisted over the famos, will work wonders. Not outs does the force with which the liquid leaves the table allow of its being directed well above the operawet handkerchief over the mouth and nose then crawl on the hands and knees, for the smoke tends to ri-with the hot air and will be less dense close to the

But if the whole of the lower part of the house is burning and cs spe by means of the stairs is impossible preparations must be made for leaving through the window. The all the sheets and blankers together the window. To all the sheets and blankers sign to by means of reck hosts which all in or all p no mai ter hos much strain is put upon them. Then drop the bedding or mattress from the sindow in order that there may be some kind of break in the event of a possible fall. Finally make one end of your im provised fire-exame fast to the bedpost drop the other end from the window, and after making sure that it reaches to or almost to, the ground go down it boldly hand over hand. It should be added that in the case of inexperienced persons there is always considerable risk of a dangerous fall resulting from this means of exit, therefore it should be undertaken only when all

other means of escape have falled

In conclusion a few words may be added respect
ing the treatment of burns and scales prior to the
arrival of a doctor. The main point to bear in mind
is that the air is to be excluded from the affected part as quickly as nossible This ma (Concluded on page 451) This may be done by

# THE HEAVENS IN JUNE

### BY HENRY NORRIS RUSSELL, PHD.

UNE, though less exciting from an as-tronomical standpoint than May, is still a month of more than usual in-

terest Halley's comet will, of course, still be the main object of attention. At the beginning of the month it is ex cellently placed for observation, about midway between Regulus and Alphard (a Hydrae) on a dark sky, setting after 11 P M it will how-

acting arter 11 P M It will how-ever be much less completious than the week before, and will seem to shrink and fade rapidly as it recedes from us. Its distance on the ist is about fifty million miles, and this increases steadily, at the rate of three and omehalf million miles a day—to which the earth's and one-half million miles a day—to which the earth's motion in one direction contributes about one and one-half million miles, and the comet's motion in the opposite direction the remainder its apparent motion in the sky is slow, for it is

moving simust directly away from us travely contword and stars, continuing the line of its carlier path but very much more slowly, covering only 13 deg dur-ing June, and 5 deg during July

During the first ten days of the month it will still be a fine naked-eye object. Then the new moon will begin to flood the evening sky with light, and drown say with fight, and drown it out. By the time she is out of the way again the comet will be 125 mil-lion miles from us, and equally far from the sun, that little can be seen of it without a field glass.
With the aid of the latter
it can probably be folloved all through the

The display which this comet has given us dur ing May is probably the finest of the last fifty TORTE

Curiously enough, its only rival in the last quar ter-century is the great comet which appeared so unexpectedly last January This was at one time much brighter than Halley's comet (owing to its close approach to the sun) but its tail was not so long and it was too deep in the evening twilight to be seen to the best advantage

Daniels comet of 1907, though intrinsically of about the same magnitude an Halley's conet, was never within fifty million

a spectacle

miles of the carth, and so never afforded nearly as fine

a spectacie

Back of this is a long barron interval. The last
previous comet which was at all complexeous to the
naked-eye was the great one of 1882. This was one of the grandest on record, and had a tall over 100 million miles in length but this was directed almost nvillon miles in length out this was directed among away from the earth, so that it never looked more than 35 deg long—as against over 80 deg for Halley's comet before it left the morning sky Before this than 35 deg long—an azainat over 80 deg for Halley's comet before it left the morring any Before comet before it left the morring any Before it is comen torgatis's comet of 1874, with a tail of 50 deg long but the last comet, fully comparable in appearance with our visitor of this year, is the great comet of 1881, whose tail was at one time present comet of 1881, whose tail was at one time present comet of 1881, whose tail was not extend the earth passed through the tail without appearance the earth passed through the tail without appearance decks to their than a general illumination of the sky on the night of passage. Three years earlier, in 1889, aneagard Donesit's comet by common consent the fishest appeared Donati's come! by common consent the finest of the last half of the nineteenth century

Several of these comets, especially that of 1882, were really much larger affairs than Halley's, but were really much larger mains than Halleys, but the very favorable circumstances of the present re-turn make it comparable, as a spectalle, with any of them, so far as can be judged from the records 'The last news at the moment of writing is that its

head proved perfectly transparent during its transit across the sun, and that its tail is so much curved in its own plane that the earth did not reach it till in its own plane that the earth did not reach it till long after daybreak on the 1916. Before dearn this morning it was a magnificent object, extending from the eastern horizon half way acrose the sky, till it was lost in the Mikhy Way Its total length up to the invisible hand was fully 120 deg, according to observations here, and 190 deg as seen at the Licht Observatory a few hours later.

OCCUPATION AND THE HEAVERS
As our marvalous visitor fides in the western heavens, we may turn once more to the old familiar constellations. In the north, below the Pole, in Casable, low on the horizon Above her is Cephens, and higher still the Little Bear, standing poised on its tail above the Pole. Beatment this and the Green Visits. higher still the Little Bear, standing poised on its tail above the Pole Between this and the Great Bear are the long coils of Draco Our initial abows the truly formidable aspect of this monster, whose form, coils and all, can be traced with decided likeness among the

the Crow and Oup resting upon his book, Sine sent far down below Virgo, are many of the stars of M Centarr and the Well. Chescreen in low latitude many the tropics, can see below these the two brids out stars of the possessiation which, though among the most brilliant in the heavens, have no Greek or Arabic names, being too far south to be to the ancients. The easternmost of the two sternment of the two, Aip Centauri, is known to all students of as our nearest neighbor in the heavens—only away as Sirius, which, so far as is now hi only half se

Farther cest, and best seen a little earlier in the evening, is the Southern Cross.

Leo, in the west, and Cancer and Cemini below complete our list. This region of the sky will be the closest watched of all during the month, for the commit is there.

## A CLOSE MAIN THE LATER MAINTHOUSE STREET diversely for the "Dr. of many modifications of the "Dr.

hunks design since it was first introduced in 1904. The Ariestican modification is distinguished by the materians arrangement of the gun turrets, the German species has avenues or the gas uturner, he terminally the powerful secondary armament and by the re-pected introduction of the triple turner. It has re-isabled for Italy—the home of constructive genius and the real birthplace of the dreadnought their—to comhine in one ship the twin turret, the triple turret, and

the context-line arrangement. Four ships are under construction for the Mediterranean power Ose, the 'Dante Alfghiert' was laid given last summer, and is to be launched in September. It has ease of the other three ships, as a second of the sease of the other three ships, as ansed "Conte of Carvor." "It is difficult to say whether their power has been under or over raised. According to the context of the other three ships, as a second of the other three ships, as a second "Conte of Carvor." It is difficult to say whether their power has been under or over raised. According to the context of the other three ships are three or three out, however, that they will

now turns out, however, that they will have no fewer than thirteen 12-inch weapons. This is a larger number of sinweapons. This is a larger number or sin-gle-caliber guns than has ever been mounted in a modern ship, although the Japanese "Satsuma" and "Aki" each carry four 12-inch and ten 10-inch, to say nothing of twelve 6-inch The ar-rangement of the guns in the Italian ships is distinctly novel There will be salps is distinctly novel. There will be three three-gun turrets, one forward, one aft, and one amidships, while a twin turret will be placed forward and aft, so as to bring its guns to bear over the lower turret. There will thus be a full broadside of thirteen 12-inch guns, with a fore-and-aft fire of five The secondary

a fore-ancient are of ave. The secondary battery will consist of eighteen 47 inch rapid-fire guns, besides the same number of 3 inch. Three under-water torpede tubes will be fitted. The displacement will be \$4,000 tons, the main armor belt 18 inches thick, and the speed 22 knots

The arrangement of the armament in the "Dante Alighfer!" is precisely the same as that in the other three ships, save that the midship turret is suppressed three ships, save that the midship turnet is suppressed, and that the after turnets are on a lower level than those forward as will be seen from the accompanying sketch, the deck runs straight from the via term in the three other ships. The "Danta" will have a displacement of 18,300 tons and a speed of 33 knots. The four ships are to be completed in 1913.

## HOW THE LAKEVIEW GUINES WAS CAPPED.

Last week's issue of the SCIENTIFIC AMERICAN O tained a description of an oil well in the midway dis-trict near Bakersfield Cal, which on March 15th sud-denly blew out the drilling tools and became the Lake-

view Gusher, the largest ell gusher in California, blowing out at the rate of over 40,000 barrels of heavy crude oil a day The force of the gas pressure was so terrific that the derrick was ripped to pieces, and oil spray was literally sent for miles in every direction. How to cap this well was a serious cap this well was a serious problem. For several weeks no attempt what-ever was made to check the flow. A tentative at-tack was then made to fasten down a wooden roof fasten down a wooden root over the head of the well

ough the roof was made of 16 by 16 timbers, the

NEW ITALIAN BATTLEMENTS WHICH WILL BE THE FIRST TO CARRY THIRTEEN TWELVE-ISON GUNS.

this subject. In pursuance of this authority, the Of fice of Road Inquiry was established

During the next two fiscal years the appropriations and the wording of the bill remained the same The and the working of the bill remained the same The appropriation for the fiscal year 1897 was reduced to \$5,000, and a provision was added authorising the in vestigation of read-making materials in the several Biates. The appropriation remained \$8,000 annually during the fiscal years 1898, 1899, and 1900, and no change use mean years 1888, 1889, and 1900, and no change was made in the wording of the bill, although the name of the office was changed from "Road Inquiry" to "Public Road Inquiries" in the facal year 1899

The Agricultural Bill for 1961 carried an appropr ation for \$14,000 and provided for conducting experiments in the city of Washington and elsewhere and collecting, digesting, reporting, and illustrating the results of such experiments. The appropriation for 1803 was \$20,000, and the bill provided for the in vestigation of the chemical and physical character of road materials. The language of the appropriation work of the office is divided into three branches, namely, the laboratory work, which is organized as the Division of Tests, the engineering work, which is known as the Highway Division, and the economic, statistical, road management, and miscellaneous work which is organized as the Division of Road

As the Division of Tests, which may be regular as a National Good Roads Laboratory, is consi as a National Good Roads Laboratory, is considered to be the most completely equipped road material laboratory in the world we give the following detailed description of the plant and work: The Assist ant Director and Chemist has charge of the Division of Testis if he has as his assistant as twitting contineer and an assistant chemist The chemical laboratory is under the insuccitate direction of the assistant chemist and the physical testing of materials is under

chemist and the physical testing of materians is unow the testing engineer. There is also in the Disision of Tests a petrographic laboratory with a petrographic to charge. The routine testing of ma-terials conducted by the Division of Tests consists of microscopic and chemi-cal analyses of specimens to determine the winears (amounting and proper their mineral composition and proper classification, and physical tests to deter-mine their comenting value hardness, toughness, resistance to wear, water ab sorption, and density (Bulletin 79 Bu

reau of Chemistry )
In addition to the routine tests spe cial studies are made regarding the use and composition of asphalts, oils, tars, compounds various emulsions, and sait solutions, with the view of preventing dust and preserving road surfaces (Bul-letin No 14) Other investigations in clude research into the decomposition of rock powders (Bulletin No 28, Circular No 38 and Farmers' Bulletin No 239), the testing of clays for use in paving brick brick burnt-clay and sand clay roads (Bulletin No 27 and Farmers Bulletin

No 311), and the corresion of iron culverts bridges. and fence wi wire (Builetin No 30 and Farmers' B

The equipment for the physical testing laboratory is as follows large impact machine for testing paving brick, impact machine for testing binding power of rock dust, impact machine for testing the toughness of rocks, Olsen testing machine for tensile, cross b ing and compression tests, capacity 20,000 pounds, Richle testing machine for testing tensile cross-bending, and compressive strengths capacity-200,000 pounds, delicate platform scales, bytemalic machine for molding briquettes, torsion balance, abrasion ma chine for testing resistance to wear of rocks, vacuum pump, dismond saw and grinding laps for making thin rock sections for microscopic examinations, ball mill for grinding rock samples into powder centrifu gal pump, diamond core drill small rock crusher, grinding disk for testing the hardness of rock sam ples, battery of pebble mills for pulverizing rock pow

ders, Westinghouse air compressor, hot air bath, gas furnace, and a com plete cement testing outfit consisting of a Fairbank torsion machine. GII more s needles, standard sieves, briquette moids, soaking tanks, etc

The equipment for the The equipment for the machine shop where test ing machines and other apparatus are made and repaired is as follows. Spend lathe, engine

lathe, drill press, power hack saw, precision lathe, saw table, universal trim-mer. The chemical labo-

ratory is equipped with the necessary chemical apparatus used in making analyses of rocks clays cements, and bituminous substances it is provided with com-pressed air vacuum, gas, hot and cold water steam, and electricity. The petrographic isboratory is provided with a petrographic microscope of the latest Fuess model, which besides the usual attachments is provided with a revolving analyzer in the tube to aid in the determination of very low doubly refracting mineral, and a Schwartsman scale for the measure-ment of optical axial angles. The methods used for mining and classifying rocks are fully set forth in Bulletin No 31

The road material laboratory was established in December, 1900 and from that time until November 30th, 1908 3 018 samples of road material were tested from practically every State in the Union. The results of tests made up to January 1st, 1908 and a brief description of the present methods of making routine are shown on Form No. 28

ARRANGEMENT OF STOCKADE AND RAFT WITH WHICH THE LANGUISM GUSSER WAS CAPPED. bills has remained practically unchanged up to the

bills has remained practically unchanged up to the present time, except that the name of the office was changed from "Public Road Inquiries" to the "Office of Public Roads" and a statutory organisation was provided in the Agricultural Bill approved March 3rd, 1986. In the appropriation bill for 1989, the rent or purchase of road-making machinery was forbidden The total appropriations to the facal year 1989 inclu-sive amount to \$473,440. The estimate for 1999-10 as approved by the Secretary of Agriculture is for

The Office of Public Roads is under the jurisdiction of the National Department of Agriculture as shown above. It has no administrative duties and exercises ntrol whatever over the roads of the United so control whatever over the rodus or the United Bitakes, its functions being entirely scientific and edu-gationals. No appropriations are made by the national governations for roads except on government reserva-tions. At the present time there are sixty-seven on-night and emissioness on the rolls of the office. The

## NEW TWO-CYCLE MOTOR'S

DEFECTS OF THE TWO-CYCLE ENGINE AND HOW THEY ARE OVERCOME:

A belief in growing among gas negline experts that the greatest improvements it gas and gamble that the greatest improvements it gas not gamble the greatest improvements in gas not gamble shire gas to greate place gamble which gets in reason lower from its cylindees by elliminating the idle revolution of the four-cyling. It is conceded that four-cylin design has practically reached the limit of its possibilities the advent the automobile having drawn the services of the brightness men in the gas engine field, the result of whose-work is seen to-day in the splendid examples of gas engines found in even the classers third of sutness and the service of gas engines found in even the classers third of sutness that the four-stroke cycle with its small utilization of one-half of the pitton arrokes will be accepted as the finality of development, the two-stroke cycle as now applied to quality unsating for reasons that are familiar to all students of the question.

It is apparent that the chief efforts toward improvement are now being made with a view to eliminating the defects herrisfore common to the two-cycle type. The chief defects of the usual two-tycle engine may

be summed up as follows

I The explosive mixture is taken into the crank case resulting in leakage and in possible explosions to the hear.

2 The new charge comes into direct contact with the hot burned gases, causing possible pre-ignition and some loss of gas at the exhaust

3 The charge is not large enough in volume because the crank case is an altogether inefficient compressor on account of its very large clearance. This means a small charge and also a large porcentage of dead gas left in the cyllinder.

dead gas left in the cylinder

4 The power is not increased materially by the
double number of explosions because of the weak

charges and your economy

Several recent two-cycle origines meet those defects
in different ways. The Newcomb engine was recently
exhibited before the Automobile (Shi of America This
is a two-cycle engine using the crank case to supply
exhibited before the Automobile (Shi of America This
is a two-cycle engine using the crank case to supply
exhibited before the three three three and
The first is injected directly into the cyllader from a
plumeer pump, the quantity before controlled by regulating the stroke of the pump. The gasoline is directed
downward into a small cup on, the bend of the piston.
When the piston rises this cup or pocket in in the
vicinity of the spark plug on that there is always an
on very light lead. This arrangement avoids several
of the defects of ordinary two-cycle engines were
the charge is limited, however by the amount of air
which can be supplied from the crank case, which
would scarvely exceed 75 per cent of the displacement
of the piston, leaving the other 25 per cent and the
will undoubbedly be more powerful, economical, and
reliable than the ordinary two-cycle motor

reliable than the ordinary two-cycle motor
Another improved type of two-cycle engine is that
employing a differential piston. This engine leaves
out the crank case entirely as a means of supplying

## A ROUGE AND READY GALVANIC BATTERY.

The back lattery for experimental work in the workmop or laboratory is one of the respis-and-resty type shat will give a moderate current of electricity for sightfree of root superses with an electromotive for all it of voits. Such abstary is suited for the excellent of a powerful electromagnet, for magnetising surposes, operating an induction coil, and for electrogister plating, electro brassing, or electro-coppering either by the hot or coil process, and for electrogisted by the hot or coil process, and for electrogisted by the hot or coil process, and for electro-grid for The following description will enable surpose

parposes, operating an induction coil, and for ever to platter platting, electro brassing, or electro coppering either by the hot or coil process, and to electro gith part to the control of a battery consisting of two coils canable of being coupled so as to give the current of one large cell or in series so as to yield the current of one rall and the electromotive force of two This inter plan is the one best sutted for coppering, brassing or electro lickeling. This type of battery has been used, and is still used by the writer for all the purposes mean timed, to over the years, so it has been put well to

the test of experience. The wood used in making the battery must be thor oughly well seasoned. An old board that has been kept years in an office or a lot will prove to be just the thing required. The board should be 1 into thick may be the provided of the board should be 1 into thick may be the provided of the provided of the battery. The side pieces unsat the growed as as to review these pieces with a very nice fitting joint as shown in Fig. 1. The bottom pieces must be made as aboven in Fig. 1. The bottom pieces must be made as aboven in Fig. 1. The bottom pieces must be made as aboven in Fig. 1. The bottom pieces must be made as aboven in Fig. 1. The bottom pieces must be made as aboven in Fig. 1. The bottom pieces must be made in linear to the pieces with a very nice fitting joint as aboven in Fig. 1. The bottom pieces must be had in high the pieces with a very simple of the pieces with a very hould size be conted with a thick sheline variable from its window of the outer surface of the squares. They should size be conted with a thick sheline variable into the side pieces and the code of the division pieces must also be well coated with thick sheline variable from the side pieces and the code of the division piece must also be well coated with thick sheline variable from the side pieces and the code of the division piece must also be well coated with thick sheline variable from the side pieces and the code of the division piece must also be well coated with thick sheline variable from the side pieces and the code of the division piece must also be well coated with thick sheline variable from the side pieces and the code of the division piece must also be well coated with thick sheline variable from the side pieces and the code of the division piece must also be well coated with thick sheline variable from the side pieces and the code of the division piece must also be well coated with thick sheline variable from the side pieces and the code of the division piece must also be well to the pieces should be di

When the battery has been put together it must be lined on the inside with a coaling of burning hot pitch. Use an old saucepan to melt the pitch in Pour some into one of the cells and tilt the battery first one side then another until all four sides have been submitted to the hot pitch. Pour the pitch have into the pitch when the pitch have the pitch have into one end red hot, and press this well into the corners and around the joints at the bottom, so as to secure brass bettery clamps to these with a strip of sheet copper tolded over the top of the earton block This is an important item. Its use will protect the brass clamp from being corroded by the acids. The size vylinders can be purchased with a copper strip and consideration of the control of the control of the analgamated by disping them into subplure acid 1 part, water 8 parts, and then rubbing all over inside and outside with quicksulver. Flace these sincs in the wooden vessel. Make up a mixture of subburdcid 2 pint, water 8 pints in a noncease pitcher, and allow it to become cold in a doubter vessel make a mix ture of water 4 pints, blurcands of soditum or pota-

A BOUGH AND READY GALVANIC BATTERY

sium 12 onnews subplute and half a plat. Allow this also to become rold. The lattive is now charged by pouring the bithren ste mixture into the provan peak around the carbon blinks and then pouring the sulpaire acid mixture into the outside square around the interpolation. The lattive is now ready for any pur poso required and will keep in good action for also the cylinders amust be removed and plazed into a story area of the cylinders must be removed and plazed into a story area of the cylinders must be removed and plazed into a story area of the cylinders and the cylinders are the cylinders and the bithronaut fure must be returned to the viewel it was made in The carbon block can also be stord on one upon blot ting paper or in a wide mouthed pickle bottle. The sail public acid mixture can be allowed to round in the wooden battery call of the cylinder of the cylinders of the c

## SAFE GASOLINE TANKS

As gasoline explo- one are due to a mixture of gasoline vapor with air 'accidentally ignited, of course) ! ! think the air in a gasoline tank could well be re placed either by water or a non-oxidizing gas such as

carbon dioxide, after the manner here illustrated in the first two designs water is used in Fig. 1 the weight of the water forces the gasoline out of the lower tank through the stopics (B. The water is no constructed that if floats when the water reaches it, closes the opening, and thus prevents the water from flowing out. To refull the tank with gasoline,

a sut tion pump is connected to the suppose A and the gasoline is also a suppose A and the gasoline is supposed in the suppose B. The latter prevents the gasoline from

escaping
Fig 2 is practically the same, but to discharge the gasoline through the stop-

THE TABLES SAFE. through the stopcock B air must
be pumped into the lowe, part to force the water into
the gasoline tank above To redli this tank with gasoline, the stopook at A is opened, letting the air out
and the weight of the water then siphons the gasoline

into the tank above through the valve and stopcock B In Fig. 2 a carbon dioxide tank is connected to the pipe A and the pressure of the gas then forces the gasoline out through the pipe B

In Fig. 4 the stopcock A is connected to the water mats or pipe when the pressure of the water forces the passine out through the stopcock B. The valve C prevaists the water from escaping into the gasoline can through the stopcock B. To refill the tank, the stopcock

A is closed and stopcock D is opened, and the water flowing out through the latter will draw the gasoline into the tank through stopcock B. The vaive B is adjusted to sink in gasoline and thus close the outlet, preventing escape of gasoline through the stopcock D.

### PLUG COMMECTOR

To make a plug connector for use in an electric pich socket, all that is required in a burned out incandrescent imm and a number of freet of heavy imm,
leaving only the base. Then break away the
glass tube that protects the leading in wires, being
careful not to fulure them. Now untwist about a foot
of the lamp cond, eareage the ender clean and slip a
short length of rubber tubing over each end. Solder
the ends to the leading in wires in the lamp base and
then push the rubber tubing over each end. Solder
the ends to the leading in wires in the lamp base and
then push the rubber tubing over each on a for form
a limited top loster of Paris, letting it project up
above the top of the plug about an inch so as for form
as insuited top to acree the plug in by This plug
connector is autiable for small motors, portable image,
and any other apparatus that draws only a small cur
rest. It exame to be used for large currents as the
heavy current used fase the reddinglish wires in the
heavy current used fase the seeding in wires in the

## A SIMPLE APPARATUS FOR EMPTYING CARBOYS

A very simple, effective and easily set up appare attus for emptying carboys of acid set, may be made in the following way from materials found in very laboratory. This will be found to be, for aspector to the acid pump or the ole-fashioned method or till ings the carboy, eathlying the liquid in a junc data then pouring it into bottles. For no futures can we ape, and this is an important factor when the ing with strong ammonia or hydrochloric acid capites of said. Set the strong ammonia or hydrochloric acid capites of said any unable of future from a carboy mather liquid any unable of the tiles from a carboy

Say one wishes to fill with hydroxidoric acid or another liquid any number of bottles from a carboy Fit every one of the bottles with two-ho ed imber corks and then through each hole put a piece of glass tubing bent in the form of a right angle with addes

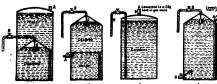

orks and then through was hole put a piece of yikas tubbug best in the form of a right angle with adden about three Inches long. Connect one piece of giasa tubing In one hostile to another piece in another to the with a annull piece of rubber tubing in the respication of this bottle with a north piece of this bottle with a norther piece in another bottle out no on until you have all the builtes connected up in now setspitch line.

Connect the free tube at one end of the line with a piece of rubber tubing to a long bent glass tube passing to the bottom of the carboy

Attach the other free tube at the other end of the row of bottles to a glass filter pump or any other suction apparatus with a piece of thick walled rub ber tubing. Then we have the apparatus as illustrated herewith.

Turn on the water tap connected with the filter pump and the acid will be drawn up the tube lead ing from the carboy and into the first bottle. As soon as this is filled the acid will run into the second bottle, and so on until the carboy is empty or

soon as that is most the able will red into the second bettle, and so on until the rarboy is emply of the requisite number of bettles are all the second bettle are in the consert is to fill say there or four buttles. When those are filled they can be disconnected and others put in thelp place. But it must not be forgotten to turn off the water tap and so stop the flow of liquid before making the change

SIMPLE METHODS OF MARING GASOLINE TANKS SAFE.

a perfect coating of pitch at these joints. Now pour the best pitch into the cell again so as to be sure that all parts are well convent. Trant the second cell in title nitanner. Raving the case now well put together, shight the centrale by giving it two ceasts of since twenths mixed with cross (cettle of from). This maple will perial the said since used in the cells and give quite as the shinks to the work. To complete and the contract of the cells and give going as the said since the cells of the cells and give going as the cells and to the work. To complete the cells and the cells and give going and the cells and the cell

APPARATUS FOR EMPTYING CARBOYS

If the liquid in the earloy is subbarrie seld oil of vitrol) or any other liquid that stroke rich the text bent tubes connecting bottle to bottle my be made in one plece and if care is taken to push the ends of the tubes below the end of the cryst the liquid want reach up to them and so they still be plaud want reach up to them and so they still be to be burt in the slightest. In fact no rubber content may be made use of except from the surface must be made used to except from the surface of the course it is more convenient to use them.

A glass filter pump is the lest to use because any fumes that may perhaps come over have no corrod ing effect on it, as they would have on a metal one

### MAKING YOUR OWN PRRPUNERY.

BY A. H. ATEU

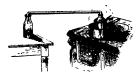

The manufacture of perfumery has always seemed a difficult process to many, and without doubt the blending of certain kinds of perfumes is a matter of much scientific and skillful manipulation, but on the other hand, the most commonly used perfumes can be made at home with simple apparatus and without much expense or trouble in many parts of the coun-try, flowers are so abundant that one can harvest all that are needed for manufacturing at home perfume enough for a year's use

A perfume garden should prove as profitable as of A pertumo garden should prove as prontance as one of fruits or exectables. We plant gardens for cut flowers and for flower seeds, but fow raise flowers for pertum making Khough perfumory is sold in this country annually to make a yearly tax of nearly ten dollars on every family. This amount is not evenly distributed, but each woman spends enough to make it worth while, if she has the garden space to try a hand at making her perfumes at hon

One must devote time to the cultivation of certain flowers which thrive luxuriantly in the vicinity in many parts of the country roses thrive so luxuriantly that fields can be sown with them, and an abundant crop raised. In other sections the rose is too slow-growing for this purpose, but the violet takes its place Again, it must be the jammine, the tuberose, the orange blossom, or lavender Whatever flower it is that thrives and possesses delicate but powerful fra grance should be chosen for the work

grance anoual no concern for the work
Direct distillation is the most satisfactory way of
making pertunery. The still is a simple affair and
it can be made out of articles found in the average
home. Take an ordinary tin oil can, scour it, and some rake an ordinary in oil can, scour it, and purify it of all oil odors Stop the spout completely, and fit a cork in the top through which the oil is poured From a hardware store get four feet of cop-per tubing (tin or galvanized iron pipe may also be used) The tube should be bent downward at the

The tin can should be filled with a nound of fig

HOME-WADE PERFUME STILL

petals gathered fresh in the early morning. Pour over these petals eight fluid ounces of alcohol. Then puthe can in a saucepan balf filled with water, and plaon a stove, where the water can be kept at the boil-ing point. A hole should be cut through the cork of the can just large enough to receive the metal tube. the an just sarge enough to receive the metal tune. Place a quart jar on a table nearby, and insert in it the other end of the tubing. This jar should not be sealed, or distillation will not go on properly. When the water boils, the alcohol in the can is beated, and this process extract the perfume from the flower petals, and gradually causes distillation through

the tube into the cold far on the table. The alcohol thus distilled will carry with it the true attar of the Alcohol has a peculiar property of extracting and holding the scent of flowers. As fast as distills tion goes on, the contents of the jar should be empties into giass bottles and socurely corked and sealed with paraffin In blending perfumes of several flowers, do the mixing after each one has been distilled sens-Do not mix the flowers in one still

Another method of using this still is to employ water instead of alcohol for distillation. Instead of attar we get the essential oil of the flowers, and this rises and fleats on the surface of the water in small globules, which must be akimmed off carefully, and immediately bottled and kept cool and air tight. When sufficient oil is obtained, it should be mixed with alcohol to retain the odor indefinitely One may with alcohol to retain the color incernitive to the may distill with water any number of kinds of flowers, and with the essential oil properly bottled, blended perfumes can then be made. A few drops of several kinds of oil are poured into a bottle containing a certain amount of alcohol, and when shaken thoroughly one has a delicious fragrance for home use. For instance, eau de cologne is made by pouring into a glass bottle a pint of alcohol, and adding half a drachm of home made attar of resemany and twenty drops each of the attar of orange peel lemon peel, and bergamot pee The distillation of these fruit peels is another desireble home industry. Cut up fresh orange or lemon peel and place if in water in the tin can, and heat as for use in flower leaves. The essential off of tilese peels will then be gradually distilled into the other receptacle fikim of the globules, and confine in corked bot-

es distillation, we have the protion, which anyone can do at home with little treaties and expense It is slightly more complicated, but it will extract the pertune of more delicate flowers, such as the violets, with greater success. This process consists of covering two large shallow pans or soup consists or covering two large analow pane or sovul plates with a layer of melted suct. The layer should be half an inch or more thick. When the fat has hard-ened, gather the violets, jamine, or tuberose flowers, and cover the suct thickly with them. Then place one and cover the suct thorny with them Then piace case plate over the other, and force down firmly. Wrag the plates tightly in paper, so that the perfume will all be retained in twanty-four hours the suct will have absorbed nearly all the perfume. Then quickly remove the dead petals, and replace with more frosh operation for several days or eve once Ropeat this operation for several days or even for a week, so as to secure a strong supply of doirs. When enough potals have been robbed of their odn; plees, and drop them into a wide-monthed bottle or glass jar containing slooked. The transference should be made as quickly as possible, and with least expo-sure to the air. Then close the bottle or jar, and seal with parafilm to make air tight As the sent absorbed the fragrance of the petals, so will the slooked rob the suet of its concentrated extract. Every day the bet-tle should be shaken a little, and in a fortnight the alcohol should be poured off through a strainer into bottles and corked

Besides making the liquid perfumes, one should consider eachet powders and perfumed pastes. These have their use in every household. A rose paste is made by steeping rose leaves in water, and pounding with a mortar until reduced to a paste. This macers tion should be thorough, and can be done with an ordinary rolling pin Now add a drop or two of your home-made attar of rose, and permit the paste to dry in an air-tight receptacle The paste will grow quite bard, and can then be cut into any shape desired. A piece placed in a drawer will scent the place for a and can then be cut into any shape desir long time If the pieces not in use are kept air-light they will retain fragrance indefinitely, and will always be ready for instant use Laid in linen and clothes see, they add that subtle fragrance to the fabrics which so many like

which so many life
Sachet powders are as numerous and as varied in
fragrance as colognes. One may compound them out
of flower pocials, agics, and partumes to suit individual preferences. The art of making sacheta is very
essential cits such simple articles purchasable at any
drug store, as iris root, musk, and rochineal (the last
for coloring only) and such apleces as clows, cimas
mon, and ginger, we have all the materials that a
mail laboratory requires for making a doese kinds
of popular sphetes. Lavender seeds rationed and curved
this color Another is manufactored by mixing trip this odor Another is manufactured by mixing tris root and ground cloves with a little musk and attar of roses, the whole moistened with a little alcohol, and then rolled and kneaded into a paste, which in time grows quite stiff A few pieces of this distributed grows quite sum A rew pieces of this distributed around in the clothes press will add a delicious edor to garments. For gifts, appropriate bottles and rib-bons or boxes may be purchased cheaply at the stores, or silk and damask can be obtained for concealing sachet or perfumed pastes, and pin cushions may be made and scented indefinitely by inclosing a good piece of the perfumed paste in the center

### AN EXPERIMENT IN SOURD.

Those who have had the good fortune to travel through a virgin tropical forest could hardly fall to have been impressed by the death-like stillness which pervades all nature between the hours of 1 and 4 This is the thermal noon of th when all life, weary with the battle with the terrible heat, seeks repose in a much-needed siests. No sound is heard save perhaps the slight rustling of a leaf. or the plaintive grupt of a tardogradus as he and the call of his mate, or reaches out for a new case

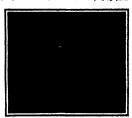

leaf with which to satisfy a never-ending appetite
Under these circumstances Humboldt, the great Ge man traveler, who was camping twelve miles from the fails of the forlince River, was actositisting in that has been considered in the fails of the forlince River, was actositisting the fail that no sound from this source reached his est, while the words were reached his early, during the shiply, when the words were reached as particle pandemonatum by the shrinks was readed as particle pandemonatum his particle pandemonatum for particle pandemonatum for particle pandemonatum for source was the same pandemonatum for source wa man traveler, who was camping twelve miles from the Potomac railroad bridge, while during a calm duty day they listen in vain for the goine of the over the Pot moving our? The very natural explanation that the noise of the day traffic masks the sound of the ears does not suffice, as the experience, of Huntieldt preven. Some light is thrown upon this problem by a restinal

of the experience of the wester, was one a longer a but force or first part of the same and the same as the same a

with conditions apparently measurements.

Prof Tyidall has described this phenomenon, attributed it to hope spanes of art, different in persure and density from the surrounding alphone, drifting in between the ear and the steam and the steam of the surrounding alphone, drifting in between the ear and the steam and the steam and the steam of the surrounding alphone, drifting in between the ear and the steam of the surrounding alphone surroundi sound These "ear clouds," for veritable clouds are, as far as the human ear is concerned, it

are, as tax as the human ear is conterred, the perfectly transparent to the exp. possess in a mar our degree the faculty of reflecting sound waven. Following is the description of a simple experies which, if thoroughly understood in all its bearing will enable one to explain some of the most ass will enable one to suplain some of the most applimatter that the supplies of the superior of note 0, which is due to 513 vibrations per second, es-ergise it by bowing or by striking it with a hammer, and hold the fork before the mouth of a bottle, say 6 inches deep and 2 inches in diameter. Instantly yes 6 inches deep and 2 inches in diameter. Instanty yet hear an increase in the intensity of the sound, be-cause the column of air inclosed by such a bottle will vibrate the same number of times per second as the fork. Now hold a second similar bottle between the prongs of the fork, as in the accompanying photo-

AN EXPERIMENT IN SOURCE INTERPRESENCE.

graph, and the sound is practically extinguis cause the creats of the waves entering one bettle colli-cials with the troughs of those entering the other Under these circumstances there is always interfer-ence, or silence Now introduce a piece of cardboard between the mouth of the bottle and the vibrating between the mouth of the botts and the vibrating princy, the colditions of interference are destroyed, and loudness is restored. But an ear cloud is quite as effective as a piece of cardboard Place a burning match or a hot poker beneath the mouth of other or of the bottles, and as the tibu layer of warm at reaches the opening it acts as a curtain, reflects the cound waves, and instantly the loudness of the tork is restored. Thus is desconatives as significant and wonderful fact, the power of a thin layer of air to reflect sound quite as effectively as a board. Now, what are the physical conditions obtaining during the day between the ears of the citizens of Washington and the bridge over the Potor nac River? The st and the bridge over the Potomac River? The sun is shaining, the strongbare is still, a hot structure of air rises from a metal root, another slightly cooler from a grass pice, another of a different temperature from a concrete street, etc. Many strate of different tem-peratures intervene between the ear and the bright, As we have just observed the effect of one structure, we can readily realize their parties the grave of completely estimated the power of completely estimated the spins of the nowing trains. At night, on the outers, the at is homosuneous, the wives are unimpeded and strike the control of the control of the control of Bearing it mind these facts, many opportunity is explicable phenomena become as element in the mosaday

## The Latest a last Freight Engine. (Concluded from page 436) miles. On these divisions there is a heavy movement of freight traffic, con-stating mostly of loaded coal trains. The le conditions on this portion of the

road are severe and sharp, curves are numerous. Against northbound traffic in which direction practically all the movement of loaded freight trains takes place, there is a six mile grade of 1 % per cent from Carbondale to Forest City From the latter point to Ararat, the sum From the atterpoint to Arrat, the sum mit of the rise, a distance of 14 miles the road is on a grade averaging 0 %1 per cent. Going down the other side of the mountain, it is practically a continu ous grade of 51 7 feet per mile for 75 miles into Opeonte

Hitherto the freight traffic on this division has been handled by consolidation locomotives, having a theoretical maxi-mum tractive power of 49,680 pounds num tractive power of 49,000 pounds
A single orgine of this class can very
satisfactorily handle a 2600-ton train
from Ararat to Oneonta, but it requires
the assistance of two locomotives of the same class, as pushers, to hauf this load up the 20-mile grade to Ararat, at which

point the pushers cut loose
With a view to reducing the operating
expenses of the division and facilitating
the movement of trains, the officials of
the Delaware & Hudson Company decided to investigate the efficiency of the cided to investigate the emclancy of the Mailet type locometives for this service It was their aim to secure a pusher on gine of this type of sufficient power to move the maximum train load up the

move the maximum train used up to the hill with two engines instead of three in the fail of last year one of the heavy Mallet engines built by the American Loromotive Company for the Eris. Railroad was borrowed, and put into pusher service on the 20-mile Arast grade A number of test runs were made which proved that a single Eric Malitt engine easily did the work of two Malict engine easily did the work of two tives Following these tests the six Mal can Locomotive Company, and put into

These engines are of a straightforward design, embodying but slight modifica tions from the designs of previous loco-motives of this type of lesser weight and power constructed by these builders and power constructed by these builders With the boiler pressure of 220 pounds and driving wheels 51 inches in diameter, the theoretical maximum tractive power working compound calculated by the

company a formula is 105 000 pounds. As this formula which is applicable nly to articulated locomotives built by this company, is based on the results ob sined from a large number of indicat cars, taken under various service condi tions, it is found that the tractive power thus calculated represents very accurately the actual power that the locomo-tive can develop at a piston speed of not over 250 feet per minute
With the companys system of com

pounding the normal maximum tractive power working compound, can be in creased about 20 per cent by changing the engine into simple. The maximum tractive power of these engines working simple is thus 126 000 pounds

### New Two-Cycle Motors

(Continued from page 144)
compressed air which would then be fur
nished by chamber B to receiver D I is well understood that the high velocity produced by air under pressure is far more efficient in atomizing liquids than the comparatively low velocity produced by suction This type of engine should produce twice the power of a four-cycle engine of the same size and apeed, and we are informed that tests now made show this to be the case

Another engine using a differential pis ton but in an entirely different way is the Shortt Motor This engine com-presses air only in the crank case. Un like the others here described it does not admit this air through a port opened (Concluded on page 450)

Inquiry No. 9162. Wented, manufacturers of a
read worked by short wart.

by the piston, but uses instead a valve which is vacuum actuated. The partial vacuum to operate this valve is formed above the larger differential piston F When this piston reaches the bottom of its stroke it uncovers a port G, through which air enters and breaks the vacuum, its stroke it uncovers a port G, through which air enters and breaks the vacuum whoreupon the valve instantly closes. The fuel is fed from a pressure tand through a needle valve, and is deliv inrough a nesure yarre, and in solve ered at the seat of the main inlet valve As the pressure in this tank is greater than that of the inrushing air from the crank case, it forces the fuel into the cylinde that the time the valve is open will vary with the speed of the engine so as to let in the right amount of fuel. The annuar chamber of the piston is used only ar canner of the pusion is used only to produce a partial vacuum which op-rates the main vaive. This engine should get sufficient air for clearing the cylinder on account of the enlarged pix-ton end and should be able to produce considerably more power than the usual wo-cycle motor

Prof S, P Thomas recently stated be fore the Royal Seciety that he had suc ceeded in producing a physiological effec-by means of magnetism. A coll of copper wire was made 9 inches in dia inches long, containing 32 turns rough this an alternating current of 50 cycles was passed, with a maximum flow of 180 amperes, giving 5,760 amp turns. In a dark room, when an obser placed his head in the mouth of the coll, he could see a faint bluish light, which was not steady but appeared to flictor considerably. This could be observed

me with the ever closed. When the en-liment was tried in broad daylight is the ever open, this fickering sens-in will permissed. The blue light, which is visible only in the dark, appeared to

How to Act in Case of Fire,

(Concluded from page 441)
fredging the part thickly with flour—if
the skin is not broken—and not disturbing it for some time.

Any vegetable oil-such as rest, or linseed-may be used with ad-niage, a rag being seaked with it and sed to cover the wound. A very good spiloation is made by mixing equal arts of linseed oil and time water, form-

geria of linased oil and time water, form-ting "carron oil."

Finally, it cannot be too strongly im-gressed that all clothing covering a burn hust be removed with the utmost care. Never try to withdraw the injured limb, but cut the clothing away—in small pieces, if necessary—so that the injured surface may not be more damaged Never hold a burn in front of the fire, never hold is burn in river to the an ecording to the popular practice, this only increases the injury. Have your oll or other application ready for immediate use as soon as the clothing has been removed.

Postencile's Theory of Comets, The idea of comparing comets to great glass lenses, which concentrate the suns giass leakes, which concentrate the same rays into luminous cones which appear as the cornels' talls, is so natural that its origin cannot be traced—it was indied by the philusopher Sensea, about commencement of the Christian era but it has been abandoned in accord ance with the example of Kepler, who after first embracing this doctrine with atter first embracing this doctrine with enthusiasm, renounced it on decovering that a large comet, which he had occa-sion to observe, possessed a curved tail. The impossibility of explaining this phe-nomenon, at a time when it was not known that light consumes a measurable time in traversing interplanetary anace time in traversing interpunerary space-caused Kepler to abandon the idea. The celebrated Fontenelle, regardless of the objection, took up and expounded the lenticular theory of camets in an ad-mirable manner in his "Plurality of Worlds." The coming of Halley a and several other comets has caused Wilfrid de Fonvicile to recall the attention of the de Pouvielle to recall the attention of the French Academy to Fontenelle's theory and the arguments which may be brought forward in its faror. At pres-ent, on the coast of every civilized coun try, phenomen similar to those to which Fontenelle attributed the forma tion of the tails of counts, are produced by the latterms of lighthouses. The dust which is suspended in the atmosphere is illuminated by the beam of light as Fontenelle supposed the cosmical dust to be illuminated by the concentrated beam of sunlight behind the lenticular comet. plains the individual poculiarities of comets, and is confirmed by observations made recently at the Paris and Greenrecently at the raris and Green-wich observatories For example, a di-vision of the tail is explained by assum-ing that the cloud of commical dust is not continuous, but intermittent, and the occasional sudden appearance of bright ts indicates the existence of a refecting body of considerable size. In a word, all the variations which are ob-served in meteoric showers might on this cory be expected to occur in the talls comets. The evidence of the spectro-ppe and the freaks of Morehouse's and of con omets are against this lenti

Engineers of the United States Geo-logical Survey estimate the annual dam-ses by floods in the United States at 150,005,000. ### WHAT WILL THE BAISING OF THE "MAINE" DISCLOSE 1

HIE action of Congress in passing a bill mak ing a preliminary appropriation for the work of rolsing the wreck of the Maine" is, for several reasons highly commendable. Chief these is the opportunity which will be afforded to give decent burial in the national cemetery at Arlto the bodies of the unfortunate men, who we carried down in the wreck of the ship, and have re alned entombed for the past twelve years. Look at it whatever way we will the fact that no effort has been made to recover these bedies carries with it seertain uncomfortable sapect of neglect, and the na tion owes it to the memory of the dead, to the sensi bilities of their surviving relatives, and lastly to its own dignity and self-respect, to recover what may be left of the mortal part of these brave scamen, and give them decent interment with proper military

Second only in importance to the above considers second only in importance to the move considers thous are those which affect the sensibilities, and par ticularly the some of honor, of a European power with whom we are at present and hope ever to be, on terms of friendly understanding for it is a fact that terms of releady understanding for it is a fact that the Spanish government fit is very keeply the implication that the destruction of the "Malne" was brought about 19 Spanish against—an implication which, though not expressed, yet in economic followed from the indusp of our Naval Insert of Inquiry, with a concluded that the Malnes was destroyed not from within, but from Walnes in the opinion of the Court, and the report, this order could have been produced to the country of the co bottom of the ship at about frame 18 and somewhat the port side of the ship

Now, although our Navy Department did not then and does not now, believe that the Spanish officials were in any way concerned in the disaster, attributing the explosion to the hatred of fanatics it is doubt ful if this opinion was shared, or is even yet held, by the majority of people in the United States.

Therefore the raising of the "Maine will be well worth all the trouble and cost it will entail, if the thorough physical examination of the wreck which can then be mude, brings to light clear evidence that can not be many, rungs to ignat over extreme tract the explosion was due to internal causes, that is to say, to the spontaneous and therefore accidental rom buston of the explosives contained in the forward magazines This latter was the explanation offered by the Spanish Naval Itoard which examined the wavek at the time of the disaster, and it is significant that it received credence not only among naval experts abroad, and especially those of England, whose atti-tude was markedly friendly at the time but alar among not a small percentage of the officers of our

OWN DELY It would be a "consummation descutly to be wished if the raising of the wreck should afford am ple cyldence or even a strong presumption, that the 'Maine' was wrecked by spontaneous explosion in the magazines. Such a conclusion would cast no discredit hatever upon the officers and men who had charge of the "Maine" on that fatal night, for it is well under-stood and has been proved by arcidents such as that which occurred on the French battleshin "Jens that which occurred on the French battleshin "Jens that under the conditions in which powder was stored at that period and for some years later it was possible for spontaneous combustion to have taken place in spite of that attrict observance of regulations, which ence before the Board showed to have been foliowed on the "Maine

Now, if this occurred, the tearing assunder of the retective deck and the blowing out of the sides of

the vessel, accompanied by the instant flooding of the portion of the ship forward of the explosion, would ave caused the weight of the ram bow, the anchor and anchor chains, to bend the forward portion down until the ram was hanging vertically below the ward until the rate was nanging vertically constituted while, held thereto only by the floor and keel plates. Then, as the main portion of the ship filled and sank, the bottom of the ship would naturally be folded down vertically against litest; leaving the keel and the double bottom in that peculiar, inverted V position, which gives it the appearance of having been blown up by some powerful force acting from below

When the cofferdam has been built entirely around the wreck and the water pumped out, it will be possi-ble, in all probability, by a careful examination of the srecked atructure, to determine how far this theory is correct. If it be proved there will be cause for gen-cral congratulation. With that awful tragedy trans-ferred to the category of unpreventable accidents, a proud nation with whom we are in friendly relation-ship will be sindicated from a charge which even today is a source of resentment that is none the less real because it is unexpressed

### REVIVAL OF THE ROTARY ENGINE

N the introductory article of a series dealing with the rotary engine which was published in the year 1897 in the Suriginary (Vol. 2011), Nos. 1109, 1110 1111), we said "The constant failure that has attended the efforts to produce a successful tolary engine, and the fact that the direct acting tolary engine, and the fact that the direct scring strank and rod, reciprocating engine has retained full possession of the field, have led many people to sup-pose that the rotary engine inventor is as visionary a dreamer as the would be inventor of perpetual motion As a matter of fact, however, many of the objects aimed at in the first device are as legitimate and useful as these of the latter are alsurd and im-possible. While the supposed advantages of a rotary confine as outlined below, have proved very attract tive to the inventor, the results of careful compara tive tests have shown that except in the case of ro tary impact engines or steam turbines, the rotary on gine does not compare in efficiency with the ordinary reciprocating type Now it would certainly m that with such theoretical and practical mechanical features in its favor, the rotary engine would prove a formidable rival to the standard type. But this it has never done, and for the very practical reason that owing to its peculiarities of construction, it is difficult to secure an economical regulation of the steem supply, and it is impossible to keep the joints steem tight and prevent irregular wear of the parts The wear of the piston is always greatest at the cir-cumference of the cylinder, decreasing toward the cen ter, and this structural defect has thus far baffled the efforts of the mechanic. The packing devices that bear against the circumference of the cylinder, like the piston bear of a vertical directs ting engine show an equal wear throughout but no amount of ingenuity has yet acceeded in compensating the variable wear of the side parking. There is a further difficulty in the fact that in rotary engines that have nly one admission port the steam pressure produ a rapid side wear on the shaft, and renders it diffi a rapid side wear on the sharf, and renders it dim cult to keep the stuffing hox steam tight. Another diffi-culty is experienced with the valve gear, which in the great majority of rotary engines is of the recipro-cating type. Reciprocations which would involve no (Attng type receiptorations winth would interest as a moderate speed become serious at the enormous speed of the rotary engine, and produce rapid wear of the paris"

was the situation in the rotary engine fi about a dozen years ago. The difficulties were of a purely mechanical kind, for the theoretical advan-tages of the type were highly attractive and never dis-We remember anking the late George M kins, a mechanical engineer of exceptional construct-ive ability, who had devoted a large amount of effort to the problem what he thought were the prospects for the production of a successful motor of this type ite expressed the opinion that the large steam leak age, due to the impossibility of making successful frictional joints coupled with the heavy frictional losses, to say nothing of the rapid wearing out of the iosses, to say nothing of the rapid wearing out of the re-proceeding valve movements had convinced him that no successful rotary could be built. As the matter then stood, it was evident that a ro-tary engine, to be successful must be absolutely rotary

in all its parts and free from any reciprocating move-ments whatsoever, that the rubbing surfaces much be reduced to a minimum, if not altogether eliminated, that steam leakage must be greatly reduced; and that some mechanical means must be found for eliminat some mechanical means must be found for eliminating the unsern wars on the main bearings due to the occasific application of the load. In the Intervention wars, in selts of apparently insuperable difficulties investors have struggled with the problems with that indominable proversame. which is no frequently has calculated of their work, with the result that at last a rotary engine of twenty home-power has been dwarf-ord, which has shown its ability to perform steady ord. shop duty, day as, and day out. To a partial income, without she'cits, way, signs of each age. Relevance to make here to the, encededingly assumed to the makes of an illustrated strict on another, which she then makes of an illustrated strict on another, which she the makes of an illustrated strict on another, which she the makes of an illustrated strict on another, which she is the makes of an illustrated strict on another, which is the strict of the makes with the success has been schwind by an ing those very conditions of a mechanical may which the experimental work of the past band years had shown to be essential to a votary onall first contain the strict of the strict which is the strict of the strict years and shows to be essential in a yeary can The tests at Essevan insultate and at the contract plant speak for themselves. It remains for the fut to determine how far the rotary will succeed in new field of high-pressure, superheated sitem, which, theoretically, it would seem to be admirst

### THE COVERNMENT AND THE INVESTOR.

HE Committee on Patenta has under consideration a bill introduced by Mr Currier, the purpose of which is to enlarge the juris may entertain suits against the United States for the infringement or unauthorised use of a patented invition in certain cases, and award reasonable compen tion to the patentee

The measure is necessary, when it is considered that under the English common law, which prevails in this country as well as in England, a sovereign power cannot be used without its own consent. The United States has established a regular tribunal, and it with the duties of a regular trouban, and canalities the gen-ernment but the scope of its duties does not include the adjudication of an inventor's rights when his in-vention has been appropriated by his government. When the government issues a patent, it does not grant a favor to the inventor, but it "scoutse him a

grain a favor to the inventor, but it "scource him a right," in the language of the Court in U S. vs. Palmer 1128 U S 271), and this securing of a right by no possible implication carries with it the opposite power of destroying the right in whole or in part by appro-priating it to the purposes of government without com-plying with that other condition of the Constitution,

the making of "just compensation"

For all that many inventors have spent years of their lives and practically bankrupted themselves in developing inventions primarily of use to the govern-ment only to find in the end that their property has been practically confinented that they have no legs means of redress, and that the governmental depart means of redress, and that the governmental separt ments will not recognize the decisions of the courts to doubt the government has the right to appropri ale an invention necessary for the preservation of the national defense yet appropriation having been made.

national defense yet appropriation having been made, it would seem that some compensation should be paid. Despite the devisions of the Supresse Court, despite the fifth amendment to the Constitution, which pro-vides that no private property shall be taken for pub-lie use without compensation the government again and again axisse private property, in the form of pairent rigats, without compensation face Court of Claims now has no jurisdiction to award compensa tion for the governmental use of a patent, except when such use is under a contract. To extend the jurisdic-tion of the Court so that it may entertain suits and award compensation to the owners of patents in cas where the use of the invention by the United States government is unauthorized, is the purpose of Mr Currier's bill

Currier's bill
A similar measure was introduced by Congressman
Dalkell in the closing days of the last Congress The
measure passed both the Ilouse and the Senate but
If was not signed by the President. Mr Currier's bill
is practically the same as Mr Dalkell's with the exception that certain patents taken out by government officers or employees, which are good against all the world, are not good against the government. This is as it should be; for when a government officer is as signed to the task of devising an implement, and the government bears the expense incidental to the inva-tion, and the officer continues to draw his salary in the meantime, it is evident that the government is the implied owner or at least licensee of the inves

implied owner or at jesse Honnese of the investion.

Il is a difficult matter to measure very light ten since of electrotatic or Winnburrt machines, owing to the glow discharge which is agt to occur above 40,000 voits. A new method has been adopted by Prof C F Guye and Mr A. Techerolavski, which was recently submitted to the French Academy of Sciences This constate in inclosing the spart gan and the electrometer in a substantial box, in which compressed gas is introduced According to the Faschon law, the distribution of the spart gan can be approached disruptive potential is approximately proportional to the gas pressure. Thus, with a given potential difference, the electrosic of the spart gan can be approached growth of the spart of the spart gan can be approached pressure, and by this shorter gap the electrosistic freeds are reinforced, insuring more accurate residing. This method has been employed in measuring the stasion of a Winnshuyut machine, which showed a voltage of 80,000 with a pressure of from 4 to 9 atmospheres in the inclosing box.

Last November there was a series of heavy snages to various to Germany, which dis considerable damage to evarious disleptones and telegraph lines As a result, a careful lavestigation was made of the question of putting such lines underground, and it was found that by using the Pupin system, underground cables could be used to good advantage on lines of less than do miles in leutit, with wires not more than three millimeters (0.118 inch in dâmster. The advantage of the underground events were found to be as forest of the underground events were found to be an other of cross tall, that there would be no interruptions due to extral causes, that there would be no denser of cross tall, that the efficiency of the line would stury be pussed for roading, due to extraval causes, that there would be no denser of cross tall, that the efficiency of the line would stury be pussed for roading, due to extraval causes, and that while laying the cables extra wires could be provided, which would pormit to further expansion to meet designation that the same cables with spik dispans, of input disarrance.

### SCIENCE

Mr. Charles M. Peck, botanist of the State of New York, in his annual report states that the known species of edible mushrooms in New York amounts to 200 Five new kinds of edible mushrooms were discovered in the last year

Dr. Gharles Forbes, of the Department of Physics in Columbia University, has installed in Bernard College the first permanent apparatus for the installation of the Foucault experiment, to show the motion of the earth Dr. Forbes set up a temporary apparatus for the experiment in St. Paul's Chapel of Columbia University some two years ago, which was described in

Dr. William Philips Blake, a member of the first class ever graduated from the Benfield scientific School of Yalo, and recent the Benfield scientific School of Yalo, and recent the Benfield Chilipsian scotty after he had received the Genfield Chilipsian the University of California. Prof Blake was 8 to your old When he graduated from Yale in 18th, became the geologist and mineralogist from the United States Preiffs Railroad expedition. His numerous activities included the editing of the Mining Magazine, sequelogical work for the Japanese government, the sx ploration of a section of Alaska, the teaching of mining along and geologist of the College of California, along and geologist of California, and the teaching of section of the University of Arisons.

The satisfactory examination of the absorption spectra of glass of various sorts requires, in addition to the thermopile, a spectrometer with glass or quartz lenses and prisms, and the exact determination of the wave length of the limit of transparency requires the use of a alit with very sharp edges a camera with an excellent lens, and a source of light the spectrum of which contains many sharply-defined lines and ex tends far into the ultra violet. The spectra bitherio employed for this purpose including the spark specof an alloy of cadmium, zinc, and lead, the trum of mercury, obtained by means of the vacuum tube or the electric arc, the spectrum of the carbon arc and even that of the Heraeus amalgam lamp (mercury, lead bismuth, sinc, and cadmium), con tain too few lines to give satisfactory results. Zick endraht has recently employed the arc spectrum of iron, which, because of its extraordinarily large number of lines of accurately known wave length, appears ell adapted for the study of absorpti A Zeiss spectrometer with quartz lenses and The results, which are published in tabular form, are too complex to be briefly described.

of. Haber claims to have solved the problem of the direct synthesis of ammonia from its elements nitrogen and hydrogen The process has been pur chased by the well known German establishment, the Badische Anilin und Soda-Fabrik If the process is as practical and economical as its inventor claims its duction will quickly cause a revolution in a paratively new but already important branch of in dustry, the manufacture of artificial nitrates in several countries possessed of abundant water power, large nitrate factories in which oxygen and nitrogen are combined directly by means of the electric arc, are in operation Prof Haber gives a few details con-cerning his process, but states that the combination of hydrogen and nitrogen is effected at a temperature of about 1,000 deg F and a pressure of 200 atmos-pheres. In a recent lecture be exhibited an experi tal apparatus which produced three our The presence of a cataliquid ammonia per hour lyser is required to accelerate the combination. For this purpose, Prof. Haber employs uranium, but the rarity of this element appears incompatible with its employment on a con mercial scale

The adulteration of food in France is said to result in a profit of one hundred million dollars per year Bread, which may be called the national food of France, has long been adulterated largely with tale, a substance which is not only indigestible, but is credingly irritating to the gastro-intestinal mucous membrane bocause of the sharp crystal fragments which it contains. Flour is often mixed with alone or with polassium exchange to the same which it contains. Flour is often mixed with alone or with polassium channels to increase the same bread fresh with copper substate and ammonium carbonate, to disnisish the quantity of yeast required and to improve the appearance of bread made with spoiled four Denatured sicolol, cesting one-sighth the price of pure airobol, is used for the manufacture of the liqueurs and ospi-sitis, which are no largely consumed in France Alciohol, denatured by the addition of methyl sicohol, is mixed with an equal void and rain, which have the effect of precipitating the methyl alcohol no completely that its flavor remains harely perceptible. The mixture is then brought to the destroed alcoholic strength by the addition of strong spirits, favored to suit the baset of the consumer and sharpened by the addition of a pint of nitrie and beauth largers.

## A COMMERCIAL ROTARY ENGIN

PRACTICAL SOLUTION OF AN AGE-LONG PROBLEM

Elsewhere in this issue we have discusthe problem of the rotary engine and set down the mechanical difficulties which must be mastered before a successful engine of this type can be produced. Reference was made to the fact that a recent rotary engine has undergone a successful laboratory test at the Stevens Institute and a successful commercial test of six months' duration at the plant of a leading tiest or six months duration at the plant of a leasing contractor in this city. This engine, which was de-signed and built by Mr Gerardus P Herrick, of 74 Broadway, this city, forms the subject of the accompanying illustrations. The principal distinguishing features—those which contribute more than any oth-ers to its success—are, first, the fact that reciprocating movements are entirely eliminated, all of the movements being rotary and secondly, that the main shaft of the engine runs upon a film of steam, whereby the destructive thrust, transverse to the axis, is completely counterbalanced

MERIANNAL PRATURES rotors or drums of equal diameter, placed one above the other, and running with the barest clearance beiween their peripheries By means of external gears, they are caused to rotate in opposite directions at the same speed The upper drum rotates within a closed cylindrical casing, between the walls of which and itself there is a bare micrometer clearance. The lower, or what we might call the power drum, rotates within a casing of larger diameter than itself, and it is provided with a rectangular piston which fills the annular space between the external periphery of the drum and the internal periphery of the casing. This drum and its attached piston also rotate within their casing with only a micrometer clearance between the adjacont surfaces. The peripheries of the upper and lower casings intersect each other sufficiently to allow the upper drum to project within the lower casing until if rotates with only the slightest clearance between

if rotates with only the slightest clearance between itself and the power drum

VAIVY MEDITATIONS—Sunk in the upper drum is a transverse, semicircular recess, which serves at once as a pocket to admit the platon of the lower drum as the two drams roll together, and also as an admission valve for the live steam, the proper registering of th piston with this pocket being assured by the fact that the two drums are geared together. Steam is admit-ted on one side of the engine and exhausted on the ted on one side of the engine and expansion, and ex-haustion of the steam are simple and easy to under-stand. As the piston (which, viewed from the side of the engine shown in our drawing, moves opposite to the hands of the clock) clears the pocket in the upper drum the latter moves forward until its les wire clears the lower edge of the steam inlet when live steam is admitted to the annular space be the piston and continues to flow therein until the

after edge of the pocket has swung round clear of the steam cylinder This point of cut-off is the popoint of cut-off is the po-sition chosen for the ac-companying illustration. During the rest of the stroke, the steam works expansively, until the after face of the piston clears forward rdge of the exhaust ports, which are shown in dotted lines at end of the circular noth swept through by the

STRAM COUNTERBALANCE The most original and valuable feature of this on gine is the ingenious meth-od by which the heavy load on the main shaft, due to the radial steam pressure in the cylinder, exactly counterby by a steam pressure acting the opposite direction the rotor being balanced in its own steam. This is accomplished by means of what are know ancing plugs, which are

anching plums, which are insteaded instannial natural chambers. There are two of these plums, one on each side of the engine. They are made of sufficient length and diameter to provide an area which, at any part of the stroke, is exactly equal to the area of the manufacture of the drum which is under the presente of the drum which is under the presente of the lets stome. For a little over half their periphery, and on the side immediately opposed to that portion of

the annular cylinder space upon which the heaviest steam pressure is developed, the belance plugs are provided with a saries of recessed steam pockets, and steam is admitted to these pockets successively by a series of holes drilled through the drum.

The piston is shown at out-off. Note small boles back of to printit steam to belending chambers Rotary engine with side plates removed

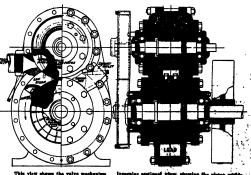

By this device the roter rides on a film of sta is taken off the main bearing The balancing plug.

journals prevented, but it is possible to showed the rotor on finely adjusted half-bearings, whose city; it sainsty to heavy the vector in true axial adjustment and the property of the rotor of the saint adjustment which has contributed to grain the saint and rotors bearing the rotor of the saint and rotors bearing by mechanism the saint saint and rotors bearing by mechanism the saint saint saint and rotors bearing by mechanism the saint fully that they could be seen accessed with the seen accessed micrometer elegantary in proved by the fact that is the tests at Stevens Institute, this engine developed him a steam consumption of 60F brake horse-power en a steam consumption of i points per brake here-power per hour; which only perms Invership with the steam consumption of the average reciprocating engine of similar capsority. It will be realised that by getting rid of packing devices and introducing a system of seam balancing. Mr. Herrick has not only prolonged the life of the rotary engine, but he has greatly increased its sutget by get-ing rid of that accountanted riction which, in serilar forms of the rotary, was sufficient to cut down the economy to a point which readered them commen-erations.

LANGEATORY TESTS.--In his report of the lab Lanaurous Therm.—In his report of the laborators thesis at Stewars institute, Pro Proyr states that the obtained the following results With a steam pressure of 145 pounds and 1,000 revolutions per minute, 20 48 brake horse-power was obtained with saterate steam, on a communition of 507 pounds of water per brake horse-power per hour With a steam pressure of 1855 pounds and 55 deg of superheat, the engine at 1,008 revolutions per minute developed 20 40 brake as 1,000 revolutions per minute cavelopes 20 40 brake horse-power on a consumption of 44 pounds of water per hour in commenting upon these tasts, Prof Pryor says of the engine "Its steadiness of operation, its lack of wibration, and its output per cubic toot of space occupied, should be particularly com-

menned
COMMERCIAL TENT—To test its commercial value
over a long period of time, the engine was coupled to
a dynamo at the Degnon Contracting Company's plant
in this city, and from August 14(th to December 11st,
1908, it served to produce the current for lighting the plant day and night. It was run for 1,685 hours, or the equivalent of more than six full working months. At the end of this time, it was again tested at the Stevens Institute; when, under similar conditions of revolution and steam pressure to those which obtained at the first test, the steam consumption was found to be 52 6 nounds, the slight increase being attributed by Prof Pryor to the fact that new ball bearings had been put in without sufficiently careful adjustment

> FUTURE FINED OF THE ROTARY —Apart from the field of usefulness open for the rotary because of its compactness, sim-plicity, perfect balance, and moderate steam conand moverate steam con-sumption, there is a far wider and more important field presented in connec-tion with the steam tur-bine. We have frequently in this journal drawn atsoon to the rect that the sum turbine is most clent in the lower uses of the expansion of steam; and that in the the steam; and that in the higher ranges, because of Sakings over the chde of the hindes, it is not as accommunat; and that at the special state of the highest it is decidedly speconomical. For it is related to the seconomical state of the secono

## THE COSTLIEST EAR OF CORN IN THE WORLD

BY FRANK C. PERKINS

In the accomplaying lituatra-tion we present ten shampion ears of sorm, which were said at the rate of \$2.545 per bushel, \$5 \$255 for the ten ne of the tor

ever paid for a single early for a single ear of corn. The obsamplos tan ears of corn shown in the illustration average 194 inches in length and 7% in dreumers cases, each ear caverying 30 revew of hernest, the depth of the keraels being % of an inch, and the average

corn might not be so profitable, or at least not so profit-able as other vari eties. Further more, the price at which ears of corn are hold may be a fictitious or a forced one A farmer may take a prize at a fair When the corn is put up at auction, the farmer, having received a large amount as pre-mium for the champion cern, can afford to bid it

## GIANT RUHMKORFF COIL

BY JACQUES BOYER

The first induction coil was made by Masson and Brigues in 1843, but it was not until 1851 that Ruhm korff gare the instrument its definite form, which has not sensibly varied since that time, although it has been improved and modified for various applica-tions. Ruhmkorff increased the number of turns of

These wires are magnetised by the primary our-rent and the mag-netic flux produces currents in the secondary cir-

The principal The principal improvements on the which have been made in Ruhm-hoffs original online the fellowing. In the first place, Fix-esu, increased the it place, Fig., increased the ner of the in-timent by om-ting the ends the primary.

the other This method avoids the production, between two adjacent turns of wire, of a difference of potential sufficiently great to pierce the intervening insula-

tion.

The interrupter, by which the primary circuit is broken at very short Retervals, was improved by Ducretet, by giving it the form of a vibrating strip of metal, and about needs and bearing at its middle point a

induction coils are usually provided with Foucault's mercury interrupter, operated by a separate battery of one or two cells.

of one or two cells.

One of the largest induction cells ever made was
constructed long ago in England for Spotitwoods, bythe instrument maker Apps. Its length was 46 inches,
its external diameter, 18½ inches, its total weight,
1,875 pounds, and the weight of its core of sort inches

From the core of th

feet of wire of a feet of wire of a diameter of 1/10 inch. The length of the secondary circuit was 280 miles. It consist turns of wire. operated by 30 Grove cells, pro-duced a spark 40

inches long

A still larger
soil was recently
constructed in Paris by Carpen tier The second ary circuit of this instrument is miles of copper wire of a diam eter of 1/125 inch The soft iron core has a length of 80 length of 80 tional area of 9.2 square inches The primary coll contains 792 turns of cop ribbon, about inch broad and 1/25 inch thick arranged in six is surrounded by

an eboulte tube more than ½ inch thick. This giant induction coil, operated by a current of 110 volts and 30 amperes, produces a spark about 50 inches in length.

The Canadian Government have appropriated \$50,zne Canadian Loveriment have appropriated \$50,000 for experiments in electrical amelting, which are to be conducted under the supervision of Dr Rugene Hannal, superintendent of mines for the Government of Ottawa.

### FIRE PLEATURE WITHOUT PIRE EMPIRES.

The practical elimination of the fire engine from fire fighting in the business section of lower Manhattan has been brought about by the successful use of the has been brought about by the successful use of the high pressure independent fire service Good results have attended also this modern magind in Brooklyn, Concy island and Philadelphia, and in all of these places independent systems of high-successory mains supplied from central pumping stations now are es-sential and established elements in much needed fire The frontispiece of this week's Scientific AMERICAN Illustrates the method and its application by the firemen, and while it is not intended to repre sent any particular plant, yet it shows the es features of a modern high pressure pumping station with motor-driven pumps and the use of the hydrants along the distribution system, such as are employed in New York city

Now if a press re of water at the hydrant can be maintained as great as that furnished by the num then the latter of course is sug cus, and that, along with adequate water supply, is cus, and that, along with adequate water supply, is what, in short, the high pressure system accomplishes. This condition however, so successfully realized, has been made possible only by modern mechanical and electrical engineering, to which the firemen have added electrical engineering, to which the firmen have added by intelligently studying and applying the new re-sources at their command. Reterring to our illustra-tion, it will be seen that the pumping attain has two sets of intakes for its water supply—one for fresh water and the other, which is also consection which water and the other, which is also consection which water and the other, which is also consection with a vacuum pump, for sait water In the case of the New York system, the Cyotion water is used under all nor-mal conditions, and the mains are kept filled at the cordinary (try pressure The deritt on the city's sup-ordinary (try pressure The deritt on the city's supply for fire purposes compared with the usual daily motion are inconsequential, but the river or consumption are inconsequential, but the river or salt water may be drawn at any time through intakes extending direct to the pier slips, and is available in case of any failure in the fresh water supply or at a time of a large conflagration. For high pressur-stations either gas or electric motors are available to drive the pumps, as there is always a supply of this kind of power from public service corporations disgind or power from public service corporations dis-tributed underground, and carefully protected and du-plicated in such a way as to make any possible failure highly improbable. Thus in the Manhattan pumping stations the high-efficiency centrifugal pumps are driven by induction motors using alternating current driven by induction motors using atternating current from the Belison Electric Company, with direct con-nection with its Waterside station and duplicate con-nection with its substations, provision even boing made to connect with Brooklyn in case of emergency A contract between the city and the company requires a constant reservation of power, and the simple opera-tion of switches puts the machinery into full operation The centrifugal pump has been found most ad vantageous, particularly with electric motors.

A high pressure system protocts a given district where the mains and hydrants have been installed and in the case of New York this territory extends from Chambers to Twenty-third streets, and lies be from Chambers to Twenty-third streets, and lies been the Hudson River and the Bowery and Third Arenue. The pumping stations are located outside of districts littley to be affected by any possible configuration, and free from danger from neighboring buildings. They are situated at South and Oliver streets and at Gamewoort and West streets. The hydracts in this system are of the type shows in the illustration, and are spaced along the mains at an average interval of 270 feet, and to reach a building on fire in no case would there be required a length of hose greater than 450 feet, an important depsideration, as the pressure in a line of hose diminisher rapidly

Let us assume that a fire-breaks out in this protected (erritory, and the slarm is transmitted in the usual way, territory, and the alarm is fribinthized in the usual way, rither from a street box of an aptomatic free-larm telegraph to fire beafquaght. These 21 is sent out one the fire-larm circuit, gift be, various free bouses in the city including the two high-pressure stations in the city including the two high-pressure stations at these stations might and day there is always an operator on duty who sits at a takephone switchboard by which the station can be pull in communication not only with the scene of fire but with headquarters and with the other station. Special Listenbown: In with with the other station Special telephones in meta-boxes are distributed in close preximity to the hydrants through the high-pressure district, and con nect direct to the station, a special service being main tained by the telephone company. In front of the operator is a large board containing the numbers and operator is a large board containing the numbers and locations of the various sizem bosos throughout the district, those to which his own station responds in-medizably being destinated in red. The sizem conses in over the regular circuit the gong sounds the appro-priate number, which is also registered by perform-sion on a tape, on which also is printed the time by a clock. If the sizem is one for the sestion the conston on a saye, or when also printed the time by a clock. If the slarm is one for the station, the opera-tor immediately grasps the lever of the marine tele-graph, and the signals to start are sounded and shown on the large indicator on the wall. The over spring immediately to their pinces, the which continues at the

d and the oliers and mach appointed stations. From the switchboard everything can be controlled and regulated. The current is can be controlled and regulated The current is switched to the motors, and the ponderous pumps are soon revolving, another switch opens electrically-controlled valves regulating the water supply, while recording and pine, never an analyzing the water analyzing and pine, never an an indicators are before the cyst of the dibet engineer. Not every fire requires the food, of water that can be set in motion from the station, and the standing order is to start one pump, regulating the pressure at the outlet at 155 pounds. The nact order must come from the chief of the fire? department at the fire, and may be a call over the telephone to increase both water supply and pressure or an order to shut down the pumps. As shown in the picture, the chief at the fire is even in closer the picture, the chief at the fire is even in closes touch with the pumping station than he could be with a sumber of separate engines located at the access of activity. The scene vitable the station when some content of the country of the countr and molectors, the entire structure is at his command Outside with the firemen there is naturally more activity, and high pressure working has occasioned certain changes in equipment and methods from the beginning the high pressure required the best and strongest hose procurable, and this in sufficient quan

strongest hose procurshie, and this in sufficient quan-tity is carried in large wagons. These hose carts are moved from the rear of the fire houses, from which they followed the engines, to the front and are given right of way over other apparatus in the streats. When the summary of the summary of the summary of the label, for must alarms the engines were not sent out, but held in respre in the fire houses. In two houses to have compared to the summary of the summary of tion hose companies maintained. As the hose is heavy, the work of carrying and hauling it is par-ticularly archous, so that, in this respect, the labor of the firems at the fire has not been lightened by mechanical progress. The automobile hose wagon used by the New York Fire Department, however, has used by the New York Fire Department, however, has demonstrated its complete user/inuses for transporting the beavy loads-of 3 inch hose much more rapidly than the tendered areas by horses. Immediately on reach-ing the fire, the hose is unloaded, a learn connected with the byfarns tutlet, of which is reached, as a successive length are hid to the seems of action. The former engineer of the fire sugarias with his lever key takes his position at the hydrant and watching the takes his position at the hydrant and watching the pressure gaps at the outlet, open or shuts the valves as ordered. The line is stretched where the exigan-ices of the "a visuo demand, perhape to the standpips connection," which must be placed at the sidewalk toes to the building walls, and which connects with the standpips itself within the building with its out-tless and hose resis on each flow. It is this that, af-tores the first predection to a superspace, in addition to the standpips that the standpip is the standpip of the term of the standpip is the standpip of the standpip of the term of the standpip is the standpip of the standpip of the term of the standpip of the by the firemen for the higher stories, or it may be used to deliver a stream to a fire in an adjoining building The connection may be made to the sprinkler sys tem of the building through a similar outlet or cellar pipe to flood the basement, or, as shown in the illustration, two lines may be siamesed into the water tower The permanent nextle holders of the hose ns may be used, while for a single stream th wagons may be used, while for a single stream tripod nosise holders are employed, as the powerful presentes render holding ble hose and directing its preactically impossible seven for two or three firmes. The hose may even have to be holsted up onto a fire escape, and there fastened or clamped with one of the devices which have been developed for this purthe cerview which have oven developed for this pur-pose. Now a single line from one of the four out-lets is practically as powerful as that derived from a fire engine, so that the concentration of pumping power on any single block can be appreciated "Pur-ther, when it is realized that these streams can be delivered with a force sufficient to tear off cornices and make their way into the very seat of the fire. their power may be appreciated

fore & 1916

A High-Promure Pire Reduction Valve. Son after the successful inauguration of the high-pressure fire service in New York city, the Sciamuran Amenican\* called attention to the need of a suitable regulating valve to be used at the hydrant, in or to render possible the control of the pressure on single line of hose and its adaptation to the work hand. The need of such a valve has become increase.

ingly apparent For some p or a water-lower or a water-lower or a street of a skyreraper, the highest preserve sign be decauseded, while specific highest preserve sign be decauseded, while specific highest preserve and a street of the same or a ridgolinity former and the same on a ridgolinity building. What was needed, as was pointed out in the Schwartzro Aussian decircle light and portable, that could be applied readily with the hose at the byfrant outside and enable any preserver from zero to the maximum hose in witness of water from friedom and otherwise and water from friedom and otherwise water from friedom and otherwise.

Musiller valve, which recently For some purposes, as for a water-tower or stand-pipe of a skyscraper, the highest pressures a be demanded, while for other lines at the same

This seems to have been secured in the Kiely and Mueller valve, which recently has undergone some thorough tests by the New York Fire Department, and has been adopted for high-pre

boats

The valve is small and compact designed to be
transported on the hose tender with the smaller tools.

There are two pressure gages, one on the inlet side
showing the pressure at the bydrant furnished by the
pumps, the other the reduced pressure as the water passes out of the valve into the line. After the hose has been stretched, the engineer opens the central valve of the hydrant with his key wrench, and then valve of the hydrant with his key wrench, and than the gate valve to the outlet from which the line is taken. The handle of the regulating valve is screwed down, allowing no water to pass. A half turn of the handle in the direction of an indicating arrow allows water at a pressure approximately of 15 pounds to pass, a full turn 30 pounds, and so on up to the full or hydrant pressure. In short, the pressure on any ie from such a valve is entirely under con the from nucl a valve is entirely under court, and the engineer merely has to watch his gage and turn his handle until the desired point is reached when the pressure is maintained automatically In a recent test before the engineers of the New York Department of Water Supply, Gas, and Electric-

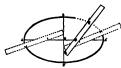

ity witnessed by the author as the representative of the Scientific American at the St Edwards High Pressure Station in Brooklyn, it met every condition Pressure Batton in Brooklyn, it met every conditions imposed Different pressures from 76 to 100 point and were put on the mains by the pumps in the adjacent station, and the pressure on the line was reduced as ordered by simply turning the handle of the valir Thus when over 240 pounds was recorded at the hydraul, 40 pounds was delivered at the nozate The Adjactance it and mainfeasance of any desired pressure were far more easily and satisfactority controlled than would be possible with a steam fire eagins Variations

adjustment and maintenance of any desired pressure were his more assisty and satisfactority controlled than were the more assisty and satisfactority controlled than in the pressures on the mains did not affect sensibly the operation of the valve while when the line was shut down at the needs no effect was manifest. The valve constaints security of a valve body, containing a seat, main disk, piston, auxiliary valve; a clashram, a compression by lings, as adjusting serve, and the portion of the metal sensetting the disk and piston are ginteructed of one pisce, and the portion of the metal sensetting the disk and piston has in it a small piget through which help for some passes up over the select, which, being of greater dismeter than the sist, drives the latter down to its seat, thus shutting of the pressure. The nota part of the operation is bredget by a combined of greater diameter than the sist, drives the latter down to the seat, thus shutting of the pressure. The nota part of the operation is bredget by a combined of greater diameter than the joyst through which the high pressure is convayed to the top of the piston, quickly causes a reduction of the state of the pressure is conveyed to the top of the piston, quickly causes a reduction of the state of the pressure is conveyed to the top of the piston, quickly causes a reduction of the state of the pressure is conveyed to the top of the piston, quickly causes and the state of the pressure is repeated, as before the reduced pressure has been alwayed to the sand transfer the sand transfer when the sand transfer of the pressure above the piston, which, order to fig piston area, causes the main valve to dose. This pressure is repeated, as either a which the light pressure, represent the sand interval when deplaced, as a big and the desired of the pressure of the pressure of the piston, as the pressure of the piston of the pis

## Astronomical Photography.

The plan of photographing the entire heavens origi-nated with Monches in 1887 The death of this emi nent man of science was one of the adverse factors which have completed to delay the work, which now, however, promises to draw to a trigmphant conclu-

The importance of the universal photographic star chart to the astronomer of the future cannot be over estimated It is now generally acknowledged that the stars are in motion with respect to one another, and stars are in motion with respect to one another, and our entire soles system is in motion through space, so that one day the constallations will be seen from a sensibly different point of view Changes will come to pass in the apparent arrangement of the star groups, and in the curres of prear they will develop, so that something may ultimately be discovered of the real structure and laws of the distant bodies of the universe It may be that the chart how being prepared will enable the astronomer of some centuries are as the series of the contract of the tem revolving within it.

hy has b years to be the only method of revealing the struc-ture of those fascinating formations, the nebules, at all adequately, the star chart on a large scale, though it be more prosaic to lay observation, possesses an in-calculable value of itself. The wonderfully accurate calculable value of itself. The wonderfully accurate phetegraphic chart may lead, with the aid of a corre-spendingly accurate system of tieseurement, to the discovery of entirely new laws of the unifying which directly affect our own planet. Seth Chandler discovnameworky at enturely new laws of the unityfest blight directly and/or our own plane. Self Chandler Glaconsed the law and evaluated the magnitude of an oscillation of the control of the control of the control of the control of the vicinity of the control of measures and for driver sight and nestero of the control of measures and for driver sight and the segmination of measures and for driver sight as a measure observation should be the fast control of the control of measures and the control of th

## Scientific American

chart over the elder method of observation is quite ty explained. The image of a star in the tele scope is very rarely absolutely steady, for the light prior to its reaching the instrument, has to pass prior to its reaching the instrument, has to peas through the vertiable sea of our own atmosphere, con-stantly disturbed, in practically all portions, by cold and hotaft currents. Rids shots are familiar with the sort of effect which is thus produced. On a blas-ing hot day, when currents of air are rising from the beated ground, the target seems to dance before the beated ground, the target seems to dance before the year, growing talker and shorter and breaking in pieces, with the bulls' we now in one corrar and now aftequether vanished Something of the same thing happens the state manage when the except is set cally when it is in a country much broken up by when it is in a country much brok cially when it is in a country much broken up by mountain chains or arms of the sea On all but two or three nights in the year the star image will be seen dancing and quivering in the telescope, more or less as the sir is much disturbed or uniform And when the observer tries to set the spider line of his measuring apparatus upon the image, he has to make some sort of estimate of its mean position and set upon that. It is really surprising how accurately this upon tax. It is really surprising now accurately this can be done after long experience, but the unstead ness of the object is bound to set a limit to the accuracy which even the most practised observer can obtain Now it might be thought that this constant vibration of the object would be more fatal to the plo bration of the object would be more fatal to the pho-tograph than to visual observation, but this is not the case. For the motion is very rapid, several times a second does the atar make a small jump from its mean position and return to it, and, on an average, if jumps every way with equal frequency. The consequence is that the photographic plate, which keeps a record of every jump, produces in the end an image which is certainly larger than it ought to be, but which is, as a rule, enlarged equally in every direction, so that its center remains still where the center of the image belongs And when the plate is put of the image belongs And when the plate is put under the microscope of the measuring machine—a device capable of accurately determining a fifty thousandth of an inch-and the threads which are moved by the measuring screw set upon the photographed image, the enlargement of the latter is more than com pensated for by any advantage which accrues from steady (mage

Bu the superiority of the astron over visual observation is not confined to the art Numerous articles in popular periodicals have quainted the general reader with the wonders of the nebulm as revealed by the photographic plate cumulative effect of light upon the latter rend constille to obtain acquisite delineations of faintly uninous objects by means of a sufficiently long expo-ure. Vast new regions of space are thus being ex-lored, and affil waster regions await of per explora-tion Prof E Ray Lankester, in an address before tion the British Association, stated that "the invention of the dry plate, which has made it possible to apply the dry paste, which has made it possible to apply photography to astronomical work is the chief cause of the great expansion of astronomy since 1881: To quote Prof. Lankester further "It was the dry plate which made long exposure possible, and thus enabled astronomers to obtain regular records of faintly lumi us objects, such as nebulæ and star spectra. Roughly nous objects, such as neuties and star spectra Rougnly speaking, those visible to the first maked eye may be stated as 8,000, this is raised by the use of the best telescopes to 100,000,000. But the number which can be photographed is indefinite, and deposits on length of exposure, 1000,000,000 000 can certainly be so reopried By the photographic method hundreds of new variable stars and other interesting objects have been covered. New planets have been detected by the dred Up to 1881, 220 were known During 188 only one was found, namely, Stenhania, being No 220. discovered on May 19th Now a score, at

discovered every year".

The appearance of Halley's comet this year suggestions. the fact that some of the most extraordinary revelstions of photography in astronomy have been in the case of these strange members of the solar system The yest size and tenuity of comets render them liable to disturbances from other celestial hodies photographic Blate has shown that the comets utterly transform themselves in a few hours' time. These transformations are sonsellmes evidently due to gravitation from some selfathors, and sangle, apparently, from actual collision with plaintily bodies or matter, which not only distorts have amortizen breaks the which not only distorts have amortizen breaks the Whater photographa on soncessive nights above that the shape though the sonce of the content of 1883, where photographa on stoncessive nights above that the state of the shape of the shape of the shape to the shape the shape to the shape the shape to the shape to the shape the shape the shape to the shape transformations are sometimes evidently due to gravi-

interpy, it is now possible, with the aid of improved in had methanics, to construct a photographic re-

ting telescope with as much precision as ment as have been expended upon the greet refracting talescopes. Prof. Ritchey has obtained aplended re-sults from his two-foot photographic reflector, and his photographs thus obtained of the nebula have a wider appeal than to the scientific mind alone. To many a person untrained in astronomical lore, indeed, the pho-tograph of the great spiral nebula in the constellation tograph of the great spiral nectual in the constraintion of Andromeda, obtained with the Yerkes two-foot reflector, would probably appeal at once as that of a most marvelous spectacle—a vast planearry system in the making About the same proportion of the sun to the planets in our own system is to be observed in the great central spherical condensation of the whirling mass and the smaller condensations in the latter Some of these smaller condensations, at varying dis-tances from the central semi-formed orb, have assumed an almost perfectly spherical shape, others, again, are formless, though vastly denser than the nebulous mat ter extending, in a circular or elliptical form, through out the entire spiral system It may be observed that the spiral character of this nebula was never even suspected until it was photographed in 1888 by Roberts with a reflecting telescope. Yet the result then obtained was crude indeed when compared with what was obtained by the instrument at the Verkes Observa tory Seen by the naked eye, this great nebula ap-pears only as an indistinct hazy spot among the stars. The greatest visual telescope in existence fails utterly to reveal the amazing spiral structure so brilliantly shown in the photograph

Judging from the results obtained with the two foot instrument Prof Ritchey estimates that an eight reflector, if used in a climate where there are ble atmospheric conditions, would photograph suitable atmosph stars which are fifty times fainter than the faintest stars which can be seen with the largest modern re-fractors "This means,' says Prof Ritchey "that uch a reflector would enable us to penetrate seve times farther into space than can now be done with the greatest visual telescopes, and therefore that such an instrument would reveal to us a universe seven times seven times seven-more than three hundredtimes greater than the universe which is revealed by the most powerful modern refractors I know of no opportunity which has ever been presented in the entire history of astronomy greater than that which now awaits us in the construction of a large modern reflector and its use in astronomical photog-

It is estimated that the cost of such an instrument as Prof Ritchey advocates—that is, one of eight-foot aperture, and embodying the latest developments in optics and mechanics—would be about one-thirtieth that of building a battleship of the 'Dreadnought'

### The Current Supplement.

One of the most important articles in the current SUPPLEMENT, No. 1796, is that by George Neumann, in which the compulsory working of German patents is discussed, a matter of great importance to American manufacturers. The adhesion of locomotives is a most important factor in designing engines, and must be considered at every step in the preparation of a gen-eral design. An article on this subject appears in the current Supplement Roze's excellent description of a profile puppet show, and how it can be made and used is continued. When shipbuilders commenced turning out iron and steel vessels, navigators found themselves confronted with the problem of overcoming the magnetic forces of their ships and making their compass needles point toward the magnetic orth How the problem is solved is told by William C Ward in a paper entitled "Compass Deviations" Frank C Perkins writes on Canadian pulp making in the Algoma district, Ontario Irish linens and some features of their production are discussed by Sir William Crawford

Three kinds of bonch marks were used by the United States Geological Survey in the spirit leveling in Ohio from 1898 to 1908, inclusive, according to a bulletin by Messrs 2. S Gannett and D H Baldwin The first form was generally used in the vertical walls of public buildings, bridge abutments or other subor public outletings, pringe automatical or of successful and a statistic meaning structures, being a circular broase or aluminium tablet, 1½ inches in diameter and ½ inch thick, appropriately lettered, and having a 3 inch stem comented into a drilled hole. The second form was employed where masonry or rock forma form was employed where masonry or rock forms tion was not accessible, and consisted of a hollow wrought iron post, 4 feet long and 3½ inches in out-diameter, split at the bottom and expanded to 10 inches so as to resist pulling from the ground These posts were such as feet in the ground—after having bean coated with asphalt—and a bronze tablet similar to the one aireafy described was then riveted to the top. The third form was little used and is now alto-gather discontinued, being the ordinary split belt of copper, I both in diameter and 4 inches long

## HOW TO ESCAPE FROM A SUNKEN SUBMARINE

## METHODS APPROVED AND DISAPPROVED

In a diving manual recently published by Slebe, Gorman & Company, Limited, submarine engineers of London, we find some excellent suggestions on the subject of saving the crews of submarine boats.

The problem of saving the lives of a crew of a sub-marine vessel is by no means easy of solution The requipment and apparatus which is invaluable on shore it quite useless under water It would be quite only to construct a submarine boat, the crew of which ould be safe under practically every conceivable set would be sare under practically every conceivable set of circumstances, but such a vessel would be so ham pered by her safety devices as to have little or no military efficiency. In the option of Messrs Biche & Gorman it is essential that the salvage of the vessel and of the crew must be looked upon as entirely Inevitable delays in the arrival of the salvage arate Inevitable delays in the arrival or to marrage vessel and in getting purchase on, conditions of tide, weather, atc. render it almost certain that a submarine cannot be raised in time to save life it is taken for granted that an accident which will

endanger the lives of the crew will result in the in rush of water in large quantities A minor accident to the machinery would result only in an involuntary

to the machinery would result only in an involuntary rash to the surface, owing to the reserve buoyancy of the boat, and any ordinary small leakage can be readily dealt with by the machinery at command.

When, however, there is a collision, or when, by some other mischance, a hole is made in the hull, the water enters freely, and the effect will be the descent of the vessel to the bottom This may not be very fast, but, assuming that the water is contents more rapidly than it can be explicit the vessel will not doubtly with the same of the vessel will not doubtly with the same than the properties of the vessel will not compressed to a pressure equal to that of the water at the depth in which she has foundered. As soon as the sail water comes into contact with the battery or at the depth in which and has followed.

It water comes into contact with the battery or with the terminals of the dynamo. If this be still

working, chlorine is evolved, and the air re-maining inside is vitiated

maining inside is vitlated
if anything is done, it
must be done quickly Accordingly, the following
steps must be taken

(a) To render the crew ndent of pois

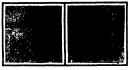

(b) To preserve the drowning in

the boat, and of escape from the boat, and ascent to the surface The devices to bring these about at present

known are (1) Air locks for es-

(9) Detuchable cham bers or life boats. (3) Belf-contained dress

Air locks slone are of Air locks alone are of little use except in shal low water, but combined with (2) or (3) are es-septial in all methods of escape The air lock may be a portion of the boat provided for the special purpose, or the general cavity of the boat may be used in which case the pressure inside the vessel as be made equal to that of the water outside by simply allowing the water to enter for it is mani festly impossible to open an aperture until the pressures at both sides of it are equal The great objection to all forms of detachable chambers or life boats is their size weight, and resistance, if made large enough to contain all the crew of a modern all the crew of a modern submarine, and as such a chamber would have to be carried as a superstruc-ture, it would be in the Hke-liest position to be injured in case of collision Moreover, what is further against sny device of this kind is that the crew are expected in a moment of considerable excitement to undertake an entirely nevel operation which there is no means

on the left shows a longitudinal sex, showing an air trap in use, three p in safety helmots, and one emering-tower that on the right a trans a submarine, showing air-traps in the air traps, wearing shorty-helmorphy from the consing-tower

of trying previously Experience has shown that even plain drop safety weights fall at the critical moment. A life-saving device to be efficient must be able to fulfill promptly the three conditions, a, b, and c, previ

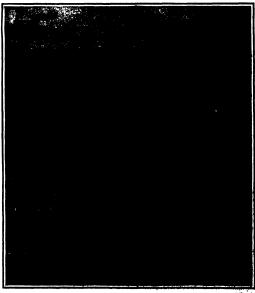

ously referred to, and in order to meet them a special form of diving heimet has been designed by Messra. Slobe & Gorman which is quite self-contained and not dependent on any feature which is liable to get out of order. The helmet, which is large enough to allow or order The neimet, waten is large enough to allow the head free movement, is sloped away to fit the shoulders, and is connected to a short jacket of strong waterproof material in front of the jacket, inside, is a pocket containing a combined air purifier and onygen generator, consisting of two small chambers formed in one once, "Hisse shambers are charged with a naturated substance which, when its conjust with the water varyor of the heath, give not gone engages pas and forms a spantle affaid. The situal is to text and the state of the state o inches by 16 inches. The dress can be put on without assistance in 30 seconds. When on it prevents a mab from drowning, and in proof of this it may be sidd that it is now it overprise under water with perfect the control of the con removal of the weights.

r.moval or the weignts.

At Portunouth the British Admiralty have in use a huge water tank, at the bottom of which is exceted a skeleton submarine boat, serving the purpose of permitting the men to exercise in the helmet described The men having first been trained to put on the dres

quickly are set to practice getting into and out of the air look. They are after ward lowered in the air lock to the bottom of the tank, where they enter the submarine, and find their way to a ladder leading to the coming tower, the They then either Sont to the surface or return to the starting point, the op-erations being repeated until the officer in charge considers the men proficonsidered the hirst pro-cient. These arrangements have been designed to rep-resent as nearly as possi-ble the same conditions as would obtain in a submar-ine boat that had been

If the hole in the sub-marine be at the top, the water will gradually dis-place the whole of the air If, however, the hole is be If, however, the hole is be-low the top, then the wa-ter will only enter until the air, which cannot ca-que, has been compressed until its pressure is equal to that of the water out-side. In the latter case there is no difficulty in moving at and putting on the helmet dress, pince there is air inside the ball. In the former case. hewever, unless some up-cial provision were made, this would not be so and

best having similar to be bettern, all will be compressed either make the desiration from the having pit on their question for some compressed att. mill it is their targe to escape of other terrors, because the partial compressed att. mill it is their targe to escape of other terrors, the partial compressed att. ## ALEXANDER GRAHAM BELL AND THE TELEPHONE

THE STORY OF A GREAT INVENTION

The telephone was first introduced to the public in 1876, and put to the first practical or commercial use in 1877 During that year was organized the first as-sociation or company to hold the pations. The first companies which systematically exploited the business companies which systematically exploited the business write formed in 137%, one for New Regiand and one for the rest of the United States and Canada. These two companies succeeded to all the rights and property of the original association. The explait represented \$170.00 the value of the patents, and \$100,000 in cash. Early in 1379 these two companies were consolidated into one company called The National Bell Telephone into one company called The National Bell Telephone Company, the first company to attain any prominence The capital of this company was \$850 000, deposited among \$500 shares of \$100 par value each The sum of \$850,000 in shares was given, share for share, for the stock of the two old companies, and \$200 000 in the stock of the two old companes, and space out in shartes was left in the treasury This treasury stock was sold for the best price obtainable, as the money was required and yielded eventually \$430,000 in cash The last 500 shares of this treasury stock sold for

The last 500 shares of this treasury stock show each in the fail of 1879 a settlement was effected with the Western Linkon Telegraph Company, whereby the most formidable and powerful competitor was removed growth of the 1810 shares, of which there were company, and though that you will be shown to the stock of the 1810 shares, of which there were company, and though that price was probably never action that the stock of the company would also the stock of the company would have been \$8.500, which were the company would have been \$8.500, of the original investors have been credited with realizing if not more, at least as much as the, yet no dividends least as much as this, yet no dividends

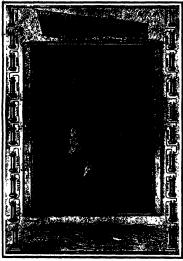

teast as much as this, yet no dividends were paid by this company
Because of the rapid increase in business, more capital was required, hence in 1850 the American Boil Tolephone Company as organised and the business of the National Boil Tolephone Company, transferred to it The shareholders of the National Bell Telephone Company were given for each share of their stock rate given for each share of their stock six shares of the next shares of the next stock. At the same time, \$600 shares of the treasury stock were sold at par in 1881 the first deglend was paid.

The American Hell Telenbare.

The American Bell Telephone Company continued in business until 1899 during which time the capital stock had nd from \$5 950,000 to \$25,886,300 increased from \$3.950,000 to \$25,885,000 When the American Bell Telephone Com pany transferred its business to the American Telephone and Telegraph Company, there had been over \$38,000 of actual cash paid into the treasury of the company by the shareholders as against \$35,885,000 expiral outgasding During the time no stock dividend or surplus in each to be for stock leaved was paid. The mended to be for stock leaved was paid.

of the American Bell Telephone Com-pany's share during the year ranged shore \$100 a share, and the company was paying 15 per rout dividends yearly! The demands of the business required much larger capital than could be provided under the corporate powers of the American Bell Telephone can pany Henry, the American Telephone and Telegraph pany Henre, the American Telephone and Telegraph Company was organized to perpeta the long-distance traffic, and to it the business was transferred in 1897 The dividends were put on a 7% per cent hast, and were increased in 1906 to 8 per cent, at which right they still continue. Since 1906 the stack of the Ameri-can Telephone and Telegraph Company has been in-creased from time to time as the business called for money At the close of 1908 there were in the hands of the properties of the telephone to the period of the telephone and telephone to the telephone to the telephone of the properties of the telephone to the telephone telephone to the telephone to the telephone teleph

This tremendone industry is the fruit of Mr. Alex ander Graham Bell's indomitable and persevering work as a young man His story of the invention of the telephone is a story of patient endeavor and experi-ment, continued for very in the tase of many diffi-culties. He approached the subject more or less as a continued of the continued of the continued of the had been issuebers of articulation and the laws of speech, and he had himself bone educated to follow in their footsteps. In bowlood he constructed a tall-ing machine At the age of eighteen he made dis-coveries which he thought original concessing the part played in the production of verse bounds by the reaso-lesses. e of the cavities of the mouth. It was not long be(ore he learned that Helmholts had not only made the same discoveries, but had produced the sounds of the vowels by combinations of tuning forts, operated by electromagnets. In order to repeat Helmholt's ex-periments, Sell began to study electricity. In 1873 he constructed an experimental apparatus in which each the sell of the between the pone of an electro-magnet. Current was applied intermittently by means of a wire which was attached to one prong of the fork and alternately and and broke the contact with a cup of mercury at the fork whrated. As the prongs of the fork were attracted by the magnet each time the current was ap-plied, the fork was kept continuously vibrating and sounding 87 pressing a telegraph key, the intermit-tent current was sent through the line wire to the s-civing instrument, which consisted of another electro-civing in the constant of the constant of the con-sistence of the constant of the constant of the con-stant of the constant of the constant of the con-tact of the conbetween the poles of an electro-magnet. Current was

Copyright 1900 by Harris and Ewing

ALEXANDER GRAHAM RELL

nist reach it with the proper frequency to cause it to vibrate. It was Bell's idea to use several transmitting forks of different pitches, and as many receiving forks of the same pitches. As each transmitter would affect only the particular receiver that was in union with it, a number of tolegraphic messages could thus be set simultaneously orac a single wire. Attaveard dest simultaneously orac a single wire. Attaveard sets simultaneously over a single wire. Atterward Bell ausstituted for the tuning fork a steel plate or reed, with one end clumped and the free end very near the poles of the electro-magnet. The transmitting reed, lits the tuning fork which it superseded, definitely made and robus consists, and thus made the curvent intermittent, and the receiving reed vibrated are registerally only when it was in union with the transmitting reed. Bittl later Bell conceived the idea of mitting reed Still inter Reil conceived the idea of polarizing or magnetizing such reed by clamping it to a pole of a permanent magnet, allowing its free end to project, as before, over the poles of the electromagnet. He knew that the vibration of the manustized reed would induce currents in the colle of the transmitting slactromagnet and that these currents, resching the receiving electromagnet through the line wire, would at the reed of the readver late vibration if the two reeds were tunded to smade submitted by the policy of the collection of the collection of the collection of the circumbrendate. The directly was apove broken and fight current, instead of being intermittent, was undulatory, varying in intensity and direction in exact accord-ance with the motion of the transmitting reed. The two instruments ways exactly althe, and other could be used as the transmitter. Several such pairs of Distruments, of different pitches, could be employed, with a line wire connecting the two stations, and the plack-ing of any reed, at either station, would theoretically ing or any reed, at etther station, would theoretical cause the reed of the same pitch, and that reed on to "speak" at the other station, so that a number meassages could be transmitted simultaneously in ea direction Bell, however, thought that the current thus generated by the vibration of the r ble for practical use in multiple telegraphy as he therefore turned his attention to a system which included a battery and a mechanical circuit breaker Meanwhile, in connection with his professional

Meanwhile, in connection with his professional work, the instruction of dest unites and their teachers, Siell had been experimenting with the phonuntegraph, an instrument devised by Lone flower the making wish instrument of a light woods never was attached to a membrane structured over the small end of a femural, and the long arm terminated in a bristle which touched a sheet of gas, covered with hampblack, which

was drawn along at a uniform speed. When a sound was uttered into the fun-When a sound was uttered fatto the fun-nel the sound waves caused the mem-brane to vibrate and the bright to trace on the modes disas a sinous curve, on the modes disas a sinous curve, actly that not only every pitch but every quality of voles, and each of the vowel sounds, produced its characteristic tra-ing. The principles of the phonustermsh is almost identical with that of the phonograph Ball discovered defects in the instrument, and as he ishored to re-move than, it cocurred to him that the best form of phonasticpreph would be an sound waves are likewise received by a membrane, the ear drum, and the vibra-tions are transmitted to the inner ear by a series of home lovers. Dr Blake, as auriest to whom Bell applied for precise nel the sound waves caused the mem aurist to whom Bell applied for pr information concerning the structure of information concerning the structure of the ear, suggested the employment of a real human ear instead of an imitation An anatomical specimen was prepared, with a fine straw attached to one of the bone levers to serve as a writing point, and Bell experimented with it in 1874, while he was attill working with his reeds and electro-magnets

Another possibility had occurr Another possibility and occurred to him. He knew that when a vowel sound is sung into an open plane all the strings that correspond to the overtones, who give the sound its vowel quality, as well as the string corresponding to the funda-mental tone, are set into vibration, so

mental tone, are set into vibration, as mental tone, are set into vibration, as that the pian repeat the particular vowal uttered. In lite manner, the transmitting reeds, it undientify numerical manner in the component single vibrations of a rewel particular to the receiving reeds, which would reproduce the wired nould at the distant station. Bell also considered the possibility of employing, at each station, one 'large electro-magnet instead of a many small socie, in common the second state of the second state of the second control of the section of the serial sound waves, in the cold to the electro-magnet, instead of in the line virs, "In the cold to the electro-magnet, instead of in the line virs, "in mentary electrical vibrations, corresponding to the components of the sectial count waves, in the could of the electromagnet, instand of in the line whys. "It is considered to the component of the country of the coun

## MOTION APPARATUS FOR AMATEURS

### AN INGENIOUS FRENCH INVENTION

The production of photographs of moving objects has hitherto been denied to amateurs, for various res-sons. It requires complicated and costly apparatus out special appliances.

rithout special appliances. A simple apparatus, called the Clnephote, has been brised to obviate these difficulties and to put motion decography within the power of every anateur phographer, at least to the actent of producing animated fireties of his Friends and his children, for the Clnephote does not pretend to vie with the subsortie apparatus by which thousands of instantaneous photopales of a long and complex some are impressed on materials of feet of Sim.

small perforations, causes the disk to rotate intermit-tently, pausing after each advance long enough for a single exposure. At the same time the shutter is alagie exposure. At the same time the shutter is automatically caused to open when the disk stops and to close when it resumes its rotary movement. For the disk containing 24 pictures arranged in a circle, the bearing is fixed at the center of the plateholder, but for the disk with 15 spirally arranged pictures, the bearing is free to move in a vertical side and, as the owing is free to move in a vertical since and, as the reciprocating pin engages successively with the spi rally arranged perforations, the disk is displaced in such a manner that each picture is made in its proper place in the spiral curve in either case the move-ment of the mechanism is automatically arrested when work and essentially similar to the mechanism em-ployed in making the negatives But, as only a very feeting illusion is thus produced by the disks which contain 24 pictures, there is provided, for these disks alone, another apparatus which can be turned by hand, sione, mouner apparatus which can be turbed by hadd, slowly and for an indefinite time, showing the pictures repeatedly in their proper order A third form of apparatus is furnished for the purpose of projecting the pictures on a screen with a lantern

A writer in a contemporary refers to numerous fail-ures of east iron fittings which were, however of the usual run of commercial extra heavy fittings of which neither the metal nor the thickness were sufficiently

### A MOTION APPARATOR FOR AMATEURS.

The Clinephote comprises two distinct pieces of apparatus one for making the pictures, the other for each hibiting them in such a manner as to give the illusion with the contine area of 
good The growth of cast iron under repeated heat-ing is discussed and reference is made to Outer-bridge's work. Steel Sittings have also failed, within the suthor's experience only four out of twenty five steel gate valves, 6 inches, 8 inches, and 10 inches in sicel gate valves, 8 inches, 8 inches, and 10 inches in diameter, were fairly tight after one, year's zer for A thoroughly sound steel custing can withstand highly approached steem, which does not initiate defects but rapidly develops them. Gun iron is high grad-ter or more, and is adapted for 180 pounds of steam with \$30 deg 7 superbest. Analysis of various speciment of Iron which failed under 250 deg, superbest are given, but the following surveasfully withsteed 300, as, superbest for four years. \$81(mo., 172 per cost, ziūjbun, 0885 per cent, phosphorus 085 per cent, managanese, 081 juod action, p. 100.

## AN INGENIOUS TORSIONAL WAVE DETECTOR

BY THE PARIS CORRESPONDENT OF THE SCIENTIFIC AMERICAN

Prof A G Rossi of the Royal Polytechnic Institu of iurin has devised a new form of detector for use it wireless telegraphy with his of special interest because f the novel prin iple it employs. He uses found in the property known as

How the torsional produced

wires A fine iron wire stretched in a magnetic field is found to lengthen at first and then shorten ac cording to the strength of the field the value effect be ing about 1 400000th of the length of the wire The sought to in crease this ef fect and to apply it to a de tector for waves The principle of the apparatus Fig 1 A fine iron wire is stretched in a

iron or nickel

stretched in a variety pair of the stretched in a variety pair of the stretched pair of the opposite sense with the intensity J J and longitudinally as above by the arrows At the same time a cur ut is sent through the wire from to to and this given a circuit magnetization to the vire with an int naity libe result of the constitution of the stretched pair in the stretched pair of the stretched pair in the stretched pair of the stretched pair in the stretched pair of the stretched

wire will have a torsion represented at  $\mathcal O$  in the direction of the arrow, this being what is known as the Wiedemann torsion effect. Leaving the longitudinal-field as it is if we reverse the current in the wire the and as it is two reverse to course it in the wires the correct and a size of the correct and t diameter leaving a gap at the center for the mirror as A spiral of insulated copper wire is wrapped about the glass tubes with the two halves colled inversely and the current consect from a and b. bits the wire. The copper spiral is designed to receive the waves from the antenna and it acts to modify the effect which we have seen above to be given by the combination of the alternating current and the bar magness in the the alternating current and the bar magnets in the wive Ween to ware as are necessively we have a constant torsion effect in the wive, that is a constant rate of vibration. When on the construct rise war affect occurs in the copper spiral the rate of the vibration is modified and the line of light on the screen is changed. The terminals a b are connected to a pair of vertical antenna wives which are insulated from ground. All the rest of the appearance is held insulated from ground. All the rest of the appearance is held insulated from ground. All the rest of the appearance is held insulated from the foor. Light for the beam is given by a Norratz lamp and the same attenuating correct circuit is used for exciting the attenuating correct through the wire. The copper spiral is formed at the top to the antenna and at the bottom to ground With such an arrangement the instrument shows the effect of waves received from a distant station and effect of waves received from a distant station and

we notice varietiens in the beam of light due to this cause. It is designed especially to be used for receiving signals formed by a necession of waves, such waves to follow each other in series so as to form periods of low frequency. The frequency is first adpersons of low frequency The frequency is links as to be the same as that of the vibratis wire Besides the tuning of the high frequency wave this allows us to use a second or local tun-

ing of the low period
waves It should be
remarked that Prof.
Rossis is strument
transforms directly as
electric vibration of low frequency into a mechanical vibra-tion and contrary to other detectors, there is no transformation of energy between the effect of the name and the registered optical indication. It is thus extremely sensitive record of the signals, the author proposes the use of a photo-

graphic band descend-ing in front of the beam and as the variations of the lat strong enough light is reflected by the mirror on the cell Owing to the sensitiveness of the instrument there is no doubt that it can be used with much bee expenditure of power at the sending station. On the other hand it simplifies the apparatus which is needed at the receiving station. An alternating current gas erator is not required in this case, but a simple vibra-tor will give the needed impulses for exciting the

## THE HEIGHT OF THE ANTARCTIC CONTINENT

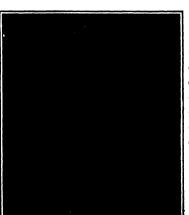

BY WALTER LANGFORD

Our knowledge of the Antarctic continent is daily be oming more precise. Soon after Shackleton's memeral le dash toward the South Pole had furnished very

imp stant data in regard to the interior I the continent Charcots voyage sup-jii d valuabl additions to out knowl dge of the boundaries of this vast terri The French expedition succeeded in surveying a urately a great many miles of coast line that had previously beet entirely unknown or only conjectur

the results of these expeditions prove it at the mass of land accumulated about the bouth Pole is even greater in com-parison with the other continents than had previously been supposed. The ele 11 its involved in this comparison in ind an estimat of area and a deter name a Both of these elements require xact and emprehensive surveys The at an joch when our knowledge of the loids estimates of the mean elevations of the known continents above the see but are far too low. This mean cleva-tion is the height of a fictitious plateau obtained by distributing the mass of the outlient uniformly over its aurface; i.e. it is the quotient obtained by dividing the volume by the area. Humboldts esti-mates of the mean elevations of conti-nents are Furope 6.7 feet. North America. 748 feet. South America. 1151 feet. Amia 1161 feet. entire known land surface of the globe 1904 feet Ex-cept in the case of Europe these values differ enormously from the more recent estimates given below. This discordance estimates given below. This discords shows the necessity of thorough expl

tion and accurate surveys although a general estimate can be obtained from elements of a totally different character as we shall see in connection with the

A 15 7 164

right angles to each other which are respectively connect ed to the two piston rods. Thus a forward and backward impulse is given simultaneously by the steam entering one cylind

cylinder of the same type, which repeats the operation while the first cylinder exhaust There are no joint, strains or withintens as the fore. There are no joint, strains or withintens as the fore. There are no referrably closed by suitable doors, to prevent dust or other extraneous matter from entering and closing or clogging the working parts. These doors are shown open in the accompanying photograph. The model illustrated has

is provided with a hollow pist rod to receive the rod of the other piston. The engine shaft is provided with two cranks at there is an equal distribution of the load When the pistons reach the end of their stroke, steam is admitted to a second cylinder of the same type, which

own remarkably high efficiency, and is so perfectly

nium hemisphere and the tire, owing to the clasticity of the air cushion, and as they are constantly in col-tact there is no wear. This ingenious little machin will blow a 16-stop or larger organ silently and with very high efficiency It requires no attention, and current sufficient to run the motor is obtained by concurrent summent to run the motor is obtained by con-mection with an electric lamp socket. As it is practi-cally silent and occupies a surface of only 45 by 16 inches and is 23 inches in height, it can be placed on the floor beside the instrument. The speed of the motor is constant, but automatic control of the pump ing is provided by a chain connection between awinging bracket and organ reservoir or believe By means of this chain the motor and hemisphere may be drawn through an arc of 90 degrees into the exattion orawn unrough an arr of we degrees into the position of full organ, while a spiral spring riturns them to the neutral position, as shown in the illustration. The rising and failing of the reservoir thus cause the speed of the believs handle to vary from zero to maximum, and keep the bellows full automatically

The peculiar fiying machine illustrated herewith was one of the novelties at the Olympia Aero Show held recently in London It is the invention of Messrs. d Ottino, and consists of a large number of small planes arranged in an endless band and driver somewhat after the manner of a tread mill, the idea being that as these planes move along from one end of the machine to the other at a rapid rate they produ

SECTIONAL VIEW SECURING CROSS CONNECTED PURTONS.

A HUADINGSVILLEDER BALANCED PROTUS

balanced that it will run smoothly on the filmsiest of SUPPORTS.

A HOVEL AUTOMATICALLY ADJUSTABLE ORGAN BLOWER.

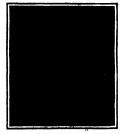

A novel method of adapting electric motive power to organ blowing is shown in the accompanying engraving The mechanism comprises an accurately turned hemisphere of aluminium driven by a small electric motor fixed to a bracket swinging horizon

a lifting effect owing to the slight angle to the hori sontal at which they are set. As they move around at one end in passing from the bottom to the top they one end in passing from the bottom to the tup they are at an angie to the horizontal and all produce a lift, while as they descend at the other rad the is downward movement produces a lifting effect. The machine was exhibited without a motor but this fact did not defract from its novely. The tids of the mov-ing planes is that the lying machine will lift listed diverly in the dar and that no forward motion over the ground will be required

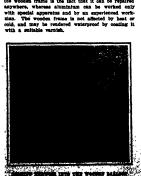

A SERPESTINE WHARP

One of the longest where it world, almost a mile in length, or to be exact, 4 700 feet is at Port Los Angeles, Cal It extends into the Pacific in a long serpentine curve. The reason for this construction is that it offers better resistance to the strong currents and the buffetings of the waves than if were perfectly straight. Until the nearby harbor of San 1 edro was developed by the Federal government, the big wharf at Port Los Angeles was a very busy place, but of late it is comparatively seldom us cept by the Japanese fishermen, who have for colony along the adjacent beach n, who have formed a

## SCRIBNER'S MAGAZINE GUIDE

 ${f L}$  $\mathbf{D}$ 

### IF YOU ARE GOING ABROAD THIS SUMMER—GOING TO LONDON

you should have in your hands before sailing, a copy of Scribner's Magazine Guide

places of interest.

This Guide is mailed free. It has been specially prepared for us and we went every reader of Scribner's Magazine, who is going strond, to have copy. The Guide contains just the most helpful and useful information. It is small, handy, invaluable. In twelve "Wallas," you are taken about London by one who knows London, knows what Americans want most to know.

Verit carry.

Your attention is also called to the special service rendered Americans in London by this Serliner Bureau. If you will communicate with our London Office on your errival in England, most desirable information and introductions to the best shops, hotels and travel offices, will be cheerfully given.

(Continued from page 168 the mother liquor this pr complicated and expensive

The brine is vaporised in graduating works, the output of which depends on season, the direction and intensity winds, as well as on the temperature and moisture of the air Each of these graduating works (the total length each is approximately 25 kilometers) is divided into seven compartments of de-creasing lengths traversed consecutively by the brine, and the sait content in-creasing as each compariment is trav-After leaving the last compart neut the weak solution is from sight to twelve times more concentrated. The bramble walls of the compartments are exposed to the wind. Hence operation of the plant is difficult in variable winds On the other hand, the surrounding all which is strongly ozonized and charged with atomized brine, not only makes the graduating works a very cool and pleasant place to stay in on hot days, but af fords a welcome opportunity for utiliz-ing the curative effects of the refreshing

and the curative elected of the salt air.

The pumps of the graduating works are operated by a number of water wheels. are operated by a number of water whe is fed from the river baise through a sys-tem of canals. From the graduating works the brine is pumped through con-dults to the reservoirs of the evaporating

house, in order there to be boiled Both the evaporating house and gradu ating works date from the middle of the eighteenth century when the Salines were erected the ancestors of most of the workmen employed therein having

The primitive boiling process carried The primitive boiling process carried out in open sait pains has recently given way to a modern multiple vaporizer with improved devices for recovering the mother liquor and the suit. It consists of a steam boiler and a number of vapor

izers an air pump etc

As the holling of the brine and mother liquor is carried out in vacuo at low tem perature the decomposition of valuable chemical compounds is entirely prevent ed, thus increasing the curative effects of the products

When the brine has been holled down to such concentration as to contain in a hundred kilogrammes (wenty two kilo hundred kilogrammes (wenty two kilo grammes of common sait a supersatu rated solution is obtained from which the sait crystallizes. As the concentration of the brine increases then increasing amounts of saits are separated which in part to the saits an acid taste. These saits are used for various therapeutle purposes while the brine left after the separation wante the brino left after the separation of the common sail forms the mother liquor used for other therapartic purposes and of which about 50 000 liters are produced per annum. For shipping great distances, the mother liquor is further concentrated until it crystallizes in

shown that the Kreuznach water con tains not only plentiful amounts of gas your radioactive emanation but carries along from the interior of the earth ra dioactive substances Part of these sub-stances as the water during the gradu air will separate along with iron oxide calcium and barium carbonate while an other part remaining in solution forms in the brine a permanent source of emana Geltel, as well as by Dr K Aschoff, have shown that the residues contain not only considerable traces of radium, but radio thorium and actinium as well The mother liquor derived from the Kreur nach brine as well as from the bathing salt was likewise found to be strongly radioactive. Further experiments demon strated the possibility of isolating traces of radium from the residues of c trating the radium salts. As the springs of Kreusnach yield every year radioactive residues by the hundredweight it was deemed advisable to attempt the produc tion of radium saits on a large scale. Mr (Concluded on page \$70)

Neumann, Director of to an method worked out by Dr Aschoff One f the wings of the boiling house onverted into a radium factory which converted into a radium reactory want a has been operated for over a year. The entire annual production of active resid uses is now worked into radium saits an end which has made possible an exten sive therapeutical use of radium com-pounds, both as a white insoluble powder of high radioactivity for compress a ointments, etc or directly in a dried con dition, and—on a far larger scale—in the shape of gaseous att ted to water

an apparatus perfected by Mr. Neu-mann renders it possible to determine the amount of emanation imparted to a n quantity of water

Mr Neumann has recently worked out an improved charging method which is especially suited for imparting to any liquids a very intense activity (2000 to 50000 Mache units) However no de-tails as to this method have as yet been ade known

Satisfactory results have been obtained by treating, by means of charged drink ing or bathing water chronic rheums-

malady, and in some cases in some trou ble in the general condition (incomnia, loss of appetite, etc.) In some cases this reaction manifests itself as a slight feel-ing of interioriton during the bath and

some minutes afterward, while other pe-tients feel especially refreshed and invig-orated. This reaction, which strikingly mbles the reaction produced by many natural bathing and drinking waters, is

of too recent date to allow definite con-clusions to be drawn, it doubtless con-stitutes a valuable addition to the present methods of modern medicine

### ALEXAUDER GRAWAW BELL. (Continued from page 162)

the free end of one of his steel reeds to the center of a membrane capareeds to the center of a membrane capa-ble, like the send drum of taking up any kind of vibration. The fixed end of the reed was not to be clamped but was to be hinged loosely to the phairsing mag-net, so that it would no longer have any definite rate of vibration but would follow all the vibrations of the membrane A similar instrument was to be used as a receiver But the apparatus was not constructed at that time because Bell doubted whether the currents generally the action of the voke alone we suffice for practical telephony Further more, he was induced by his associate to devote his attention to multiple teles raphy

One day in tuning and testin One day in tuning and testing the clamped reeds of his transmitters and re-ceivers he found that the receiving reed vibrated and sounded when the trans mitting reed of the same pitch was plucked although the battery was not in This discovery convinced him circuit This discovery convinced hin that the membrane speaking telephone dovised a year earlier could be made to

The long and patient researches tha followed cannot be here detailed Mem branes with attached patches of iron and steel of various dimensions were tried and the apparatus was varied in man; other ways. Then it was discovered tha a thin sheet of iron could be used as the membrane. Thus were developed, success sively, the apparatus patented in 1876 the telephones that created so profound a sensation at the Centennial Exhibition in the same year the instruments pat ented in 1877 and the familiar hand tele phone which with some modifications is still universally employed as a teleph receiver

From the beginning Bell had at at the production of an undulatory cur rent capable of representing all the ponent harmonic vibrations of vocal sounds This fact sharply distinguished his invention from the old Reis telephone which, employing an intermitten current produced by alternately making current produced by siteriately, maning and breaking the circuit, reproduced only the pitch of a sound, but not its quality or timble and was consequently unable to transmit vocal sounds and articulate

aperch

It is safe to say that no patents for
any invention have been subjected to
such long and bitter litigation as the
Bell telephone patents During one of
the many suits which involved the validity of the patent Mr Bell was on the stand for fifty two days during which time he recited the history of his inventhat still characterise both his welting and his speeches. As we see it to-day the telephone is practically the same in principle and construction as when it principle and construction as when as left its inventor's hands, so far as the receiver is concerned. Few inventions have changed so little. To be sure, the ing or bathing water chronic rhemma- left its inventor's hands, so far as its months of colors, and gout, while a receiver is concerned "Pew Inventor number of other complaints are favor above changed so little. To be serve the complaints of the contract of the superstate has a proposition of the complaints of a designating of a designation of the complaints of the comp appearance of the apparatus has been greatly modified. The multiple switch have been introduced, and the very dis-cult art of telephone engineering has been

m ability. He even states that had it t been for his father-in-law, Mr. Hub (Concluded on page \$75.)

where the property of the only art with which Professor Bull's name is linked by wireless signaling, too, he made some significant of the work of the property 
the experiments were conducted
Aerial locomotion is another art with
which Professor Bell has become identi His interest in the subject was ed when, in 1880, he began to make kite-fiving experiments, largely for the sake of his health He started with a Hargrave box kite and eventually devel oped the tetrahedral principle, which is now well known among aeronauts. Dur-ing the course of his experiments he found that he needed the services of civil and mechanical engineers. Accordingly, a little association was started under the name "Aeria! Experiment Association." which included among its members the late Lieut, Selfridge, Glenn Curtim, Baldwin, and McCurdy, all of them now well known. Baldwin and McCurdy acted as engineers, Curtiss was the motor author ity. The association was Mrs Bell's idea, and was founded to carry on Mr Bell's own work. She sold the only piec of property which was here in her own right, and which had not been given to her by Mr Bell, in order to finance the Although these engineers were all originally engaged to help Mr Bell in his tetrahedral experiments, the sent in an terrandral experiments, the numbers of the association ended by help-ing one another Selfridge was the first man who profited by the association's ansistance. Believing that it was best to follow in the footsteps of others, and then to improve on their work, he start-ed with gilders, and finally built the "Red Wing," which flew successfully Next came Baldwin's chance He embod-ied his ideas in the "White Wing," in ted his Ideas in the "White Wing," in which wing tips were introduced, con-troiling devices which are now the sub-ject of so much controvery. Then came Curtiest" "June Bug," which won the Scientific American Trophy McCurdy fol-lewed with the "fility Dart." Baldwin and Ball worked at the tetrahedras prin-ciple. In More Societ, surrelineates which and Ball worked at the intrahedral periodic in Nova Scotia, experiments which are not yet concluded. Curties remained it Rammondeyrt. New York, and finit yellow year received that it was security and acceptance of the conclusion was seen acceptance of consumptingations. HEIGHT OF THE ARTARCTIC CONTINUES.
(Concluded from page 464)
concludes that, if the continent covers an

CONCINGENT FORM page 484) concludes that, if the continent covers an area of 5,200,000 aguare miles as Bruce and Kreummel assume, its mean elevation above sea level is about 6600 feet with a probable error of 1 680 feet. If this estimate is approximately con-

rect, as the results of the recent explora-tions appear to indicate, the Antarctic continent is by far the highest mass of much on the globe. By the addition of this huge polar cap the mean clustering of the entire land surface of the is increased from 2.312 feet to 2.706 feet. The process by which Meinardus reached these conclusions may be sketched as follows it was already known that the mean height of the b ometer over the northern hemisphere is 08 millimeter higher in January than in July, but that the corresponding barometric height for the zone extendin equator to 50 degrees south latitu is 21 millimeters lower in January than in July Hence, as the entire mass of the atmosphere and consequently the ole surface of the globe remains co stant, the mean barometric height for the zone south of 50 degrees south latitude, which is equal in area to about one-fourth southern hemisphere, must be bout 36 millimeters greater in January than in July

observations made by recent explorers, however, led Meinardus to the conclusion that the mean atmospheric pressure over the zone lying between 50 degrees south istitude and the Antarctic circle is not greater, but is 0.73 milli-meter less in January than in July This result increases the January deficit of pressure and restricts the area in which it can be made up to the Antarctic zone, in which, consequently the mean atmospheric pressure must be 11 millimeters higher in January than in July Within the Antautic (inch the only observations available for this discussion are those of the ships Discovery Helgica and Southern (ross,' which together com prime the records of four entire year In three of these years the atmospheric pressure was lower in January than in Thus the area in which compensa July tion for the deficit can be sought is still further restricted, apparently to the A

arctic continent Meinardus finds the explanation of this puzzling state of affairs in the great height of the Autarotic continent. The atmospheric pressure diminishes as the elevation of the point of observation in creases, and the difference is greater at low than at high temperatures. Hence, in a region where the atmospheric prisure is constant throughout the year the sea level, it is appreciably higher in summer than in winter at an elevation of several thousand feet. For a given ele vation this difference increases with the difference between the summer and the Hann have computed that the me mounteric temperature of the Antarctic ontinent is +266 deg F in January (Antarctic midsummer) and -148 deg F in July (Antarctic midwiner) In these conditions it can be calculated that the mean excess of lanuary over July pressure (!! millimeters) required for the entire Antarctic zone would be fur nished by a mean elevation of that zone of about 4 400 feet on the assumption of a constant atmospheric pressure at the sea level But the coasts of the Antarctic continent have been explored aufficiently to make it reasonably certain that that continent occupies very approxi-mately, two-thirds of the entire area of matchy, two-thirms or the entire area or the Antarctic zone. Hence, on the as sumption of a constant atmospheric pres-sure over the remaining third which is covered by water, Weinardus arrives at the conclusion that the average height of the Antarctic continent is about 6,600

NEW YORK, SATURDAY, JUNE 11th, 1910

The Editor is always that to receive for examination illustrated articles on sublects of timely interest. If the photographs are sharp, the articles short, and the force instantie the contributions will receive special attention. Accupied articles will be paid for at regular space rates. THE REW ERA OF ARROWAUTICS IN AMPRICA

T is a curious anomaly that, although America the birthplace of the practical flying machine a distinction which is universally admitted and stands in little danger of future disputation the further development of the art of flying, as first demonstrated by the Wright brothers, has hitherto demonstrated by the Wright brothers, has hitherio been confined mainly to Furopean countries To us, it has always seemed probable that our apathy was more apparent than real and that when sufficient stimulus was offered, the art of aviation was

sure to come into its own, and its development be cuted with a zeal that was worthy of the energy and liberality of the country in which the first prac thal flying machine had its birth.

Evidently the needed spur has been afforded by the henomenal achievement of Gienn H Curtiss in mak parameters as neverment or Grenn H. Curriss in making his recent flight from Absany to New York at the unprecedented apend of over fifty miles an hour—a feat which vindicated both the far-sightedness and the liberality of the New York World in offering a

prize of \$10,000 for such a flight in connection with the recent Hudson Fulton festival

Apart from the fact that so great a distance was covered at so high a speed there are other considerations which largely account for the powerful hold which this flight has taken upon the public imagins tion, such for instance, as the altogether untried na rure of the course the almost complete absence of suitable landing places, and the absolute composure with which, when an emergency landing had to be made, the aviator circled in his path, swooped down, hird like, upon a small open clearing above the rocky and bill-covered cliffs landed, started again on final leg of his course above the crowded shipping of the North River, and finally came to rest on Gover of the North River, and finally came to rest on Gover nors Island at the very doors of the house which was built for him during the Hudson Fulton seronautical contests. Here was a man who at the very first trial and over a course which because of the encompassing mountains and ravines and the resulting air currents was believed to be exceptionally difficult accomplished with evident composure and at times with a suggestion of complete sang froid a feat of flying which only six months before, was regarded as a dream of the enthusiant

When the news of his accomplishment was finshed When the news of the accomplishment was many throughout the country its effect was instantaneous and positively electric. The last doubt as to the prac-ticability of long-distance cross-country dying van labed and the evidence of the awak cling was shown in the almost immediate offer of over \$100.000 in privas for flights of a similar character, to be held during the present season in various parts of the United States First came the simultaneous and mu-nificent offers of \$25,000 by the New York Times and the Chicago Evening Post for a Chicago-New York flight of about 860 miles and of the Vew York World and the 81 Louis Post Dispatch of \$70,000 for a 8t Louis-New York race over a 1000-mile course Then the Washington D C Chamber of Commerce and the Aere Club of Washington offered \$20,000 for a 225-mile race from Washington to New York and as we go to press a \$10,000 prize is being promoted in St Louis for a flight from that city, over a distance St Louis for a flight from that city, over a distance of about 250 miles to Kansas City and \$5,000 is offered for a flight over a 250-mile course from Indianapolis to Chicago

are the attractive prises that have been made available, within a week of Curtiss's flight, to pr long-distance feats of the same character. At the same time, through the liberality of Mr Edwin Gould, as noted elsewhere in this journal, attention is being directed to the mechanical improvement of the aeroplane itself, with a view to enlarging the ability to remain continuously in the air and extend the dura-tion of its single flights. The offer of the large sum of \$15,000 for the best successful aeroplane provided with two motors, one to be held in reserve for em

gency, is certain to prove a great atmolus to inventors and constructors, and should result in the production of some very interesting combinations of motive power. The above résumé of the happenings of the past week surely justifies the statement that, when the history of the art of flying in America comes to be written, this period will stand out as second only in importance to those ever-memorable days, when the Wright brothers were making their flights above the sand hills of North Carolina in the first practical mancarrying and controllable aeroplane propelled by its

### THE PERIL OF THE SUBMARINE.

UDGED by the number of tragic disaste has overtaken the submarine during the past few years, this greatly dreaded instrument of war might seem to be as great a menace to friend as to fee in the absence of accurate information as to how many lives were accounted for by the submarine during the Russo-Japanese war, it is a question whether in the last ten years the submarine has not caused the death of a greater number of its own crews than it has of the enemy, and we hazard the statement that considerably over half a hundred lives have been sacrificed during the past hundred lives have been sacrificed during the past ton years in the ordinary peace maneuvers of sub-marine vessels. The long roll of disaster is headed, in point of loss of life by the sinking of the French vessel "Pluviose" on May 26th last, off Calais, when 28 officers and mes lost their lives. The most fatal, as it is the most frequent, cause of serident is collsion We all remember the running down of a British submarine off Spithead by an outward bound Ori ent liner which came up from behind unnoticed, and apparently passed entirely over the submarine Within the year a similar accident happened at the en trance to the English Channel, when a large ship ran through a fleet of submarines at night time sinking one of the boats. To the same cause was due this recent French disaster, the 'Pluviose' being struck by the paddle-wheel of a Calais Dover passenger steamer

as the latter was leaving Caisis harbor
At the same time, although we deplore the terrible loss of life which has occurred, we must not permit these disasters to shake our faith in the utility of the submarine for the accidents have been chargeable to nefficient handling, or shall we say to lack of sufficlenity we experience, rather than to any inherent mechanical defects in the design or construction of those due to collision the losses have been chargeable, not to theoretical or mechanical defects in the ance, not to theoretical or mechanical excess in time boats themselves, but to carelessness or inexperience in their manipulation. Testimony to this affect was afforded by the diary (an amazing document) which the commander of the Japaness submarine, that was rently sunk continued to write up to the very hour of his death, in which with characteristic Japanes nobility he took the blame for the loss of the vessel directly upon hims if Mechanically speaking, the directly upon himself highly-developed submarines of to-day as exemplified in the latest types built for our own navy, are thor-oughly reliable. The writer speaks from experience having spent some four hours and traveled some of Cape Cod, in the recently completed "Stingray" The vessel descended, ran on an even keel, rose to the surface and was steered, with absolute precible air within the submarine was perfectly whole and free from odor and the composure of the officers and crew betokened a perfect confidence in the stability of the vessel

The disaster to the "Pluviose" procisims the The disaster to the "Futurions" proclaims the necessity for that eternal vigilance which is the piedge of safety in travel not merely beneath the see but in the air and on the dry land. The charge can be no longer made against the submarine that it is "blind" In the perfected periscope, the vessel is provided with an eye whose vision is as clear as that of the binoru lars of a commanding officer on the bridge of a war ship Furthermore there has been produced and is now obtainable a periscope which commands a view now obtainable a periscope when commands a view of the complete horison during such time as the sub-marine is within, say, ten or fifteen feet of the sur-face, and with such an instrument, given clear weather and a careful lookout, the danger of being run over by a ship coming up from behind should be completely eliminated. The accident to the "Pluviseems, however, to have been due to the sub marine rining to the surface just ahead of, and in the path of, the Calais steamer. Here is a very real and not easily prevented danger. Although the com-manding officer may take a careful survey of adja-cent waters and note the position of other craft beforce he diven, week is the speed of modern remaind that a city may usuity have peaced held foce projects ity by the them with submarine rises signi to the city face, even though the period of submarries he lim-ited. Collision on right; to the surface is a form of accident which for the present, at least, must be recarded as not entirize presentable. regarded as not entirely preventable.

Jeneie ex, 1000

### "MEGHANIPULATR."

If the proper role for language to play in the round of our delly life is that not of massive, but of servant of our secsessities, we should survival to the secsessities, we should survival to the secset of the survival to recognized necessity.

recognised necessity.

It is agreeably to this spirit that we indorse use of the word "mechanipulate" to designate the handling of a piece of work by a machine At the present time, all the many elaborate and ingenious operations which are performed by mechanical h and fingers frequently with a close approximation to the delicacy and dexterity of the movhuman hand, have to be designated by the word "ma-A W Wood, and as far as we know, its first use to be found in his article on "Modern Stereotypy," 12 the issue of the SCIPATIFIC AMPRICAN SUPPLEMENT of May 14th, in which, speaking of a plate that has been cast he says "It is left face up in position to be most easily mechanipulated, the position to be most easily mechanipulated, mechanism used for the purpose acting with a gen ite, uniform motion to position the matrix with accuracy," etc. Then, in a foot note the writer says. "In my experience, I have frequently felt the need of a word which should express the 'handling' of its work by a machine, as the word 'manipulate' expresses the by a machine, as the word 'manipulate' expresses to handling of the work of a man by his hands. To fill the gap I have made hold to coin and use the word mechanipulate,' which is here employed.' In bring-ing the suggested word to the attention of the public, we invite a discussion of its merits in the co

### THE COLDEST REGION OF THE ATMOSPEERS

HE decrease in the temperature of the air with increasing altitude—exemplified in the fact that the top of a mountain is colder than its base—is a matter of common knowledge. It is a fact that occasional inversions of this distribution of temperature may occur—as when fruit trees in a valley bottom are nipped by a frost that does not touch the hilitops but it remains true in general, that the temperature of the air decreases upward and that the air at great altitudes is extremely cold as compared with that at the surface of the earth

Until Telescrenc de Bort announced his discovery of the isothermal layer, eight years ago it was not sus pected that this decrease of temperature did not ex-tend upward to the limits of the atmosphere. Now, r, we know that at a certain altitude, averes middle latitudes, about 11,000 meters ( miles), the fall in temperature with increasing alti-tude ceases rather abruptly, usually giving place to a rise of temperature for a certain distance upward,

rise of temperature for a certain distance upward, above which the temperature romains approximately constant as far as the highest ascent and particularly constant as far as the highest ascent apparatus Hunce, above any given pool on the earth's surface that air is collect Just below the region of the upper the control of the provided of the provi coverer, the strain (ospherr),

The altitude of the isothermal layer varies with the basedmetric pressure at the earth's surface with the season, and especially with the latitude. It is some-what less over the poles than over middle latitudes and very much greater over equatorial regions than anywhere also in the world. In other words, the decrease of temperature with altitude continues to a crease of temperature with attitude continues to a much preast religit within the tright than cleawhere, and this explains the fast that the lowest temperature ever registered in the atmosphere was met with almost exactly over the equator, viz. —4.3 deg C (—115, deg F), at an altitude of 19.50 meters (about 19 miles), at Shiratt, on Victoria Nyana, Angust 20th, miles), at Shiratt, on Victoria Nyana, Angust 20th,

This was one of many interesting results of the remarkable series of sounding-ballon ascensions about the remarkable series of sounding-ballon ascensions about the cutoff in equatorial Africa by the expedition under Beson and Illian, sent out by the Royal Observatory. Other testing the complete report of which has just been published by the observatory.

### Scientific American

John II, Igro.

EMOINERING.

Generally is proceeding so satisfactorily at the
Satum locks that in the upper or lake-level tier, which
formed the shiper of reconst illustrations in our columan, about one-half of the work is completed. The grand total of excevation done on the canal during April was 2,632,468 cubic yards.

In a recent paper, Rear-Admiral Bacon of the Brit-isk navy, discussing the probable battleship of the tag navy, discussing the products activished to the future, arrives at the conclusion that the race between gun and armor, which has been going on for over half a century, has been decided, for the moment, over nam a century, name own section, for the moment, in favor of the gun, nor is there any indication of there being a chance of improving the armor and strengthening general construction, so as to render ships reasonably immune from armor-piercing projecting projecting the strength of the strength o

The fact that the excavation of the Panama Canal through the Culebra range of hills has set in motion a mass of 2,000,000 cubic yards of material, which is mass of 3,000,000 cente yards of material, when is sliding into the excavation apparently on an inclined anhatratum of clay, serves to illustrate one of the many advantages of the present high level canal over one at sea level The sea-level cut would have been carried eighty feet deeper, and the sildes would have been, in all probability enormously greater. The material will have to be removed, but outside of the additional expense, no ill effects are to be apprehended

The Budson and Manhattan Railroad Company is to be congratulated on having introduced some all-stee baggage cars for the transportation of baggage between the several steam railway terminatis severed by its gratem. The sides of the cars are provided with roller curtains. There are also folding aprons, which can be let down to bridge the span between the loading platform and the car. Eight loaded bagages trucks can be wheeled directly into the cars, an arrangement which eliminates much handling and trucking and fa cillitates quick leading and unloading the several steam railway terminals served by its

It has been determined that the sinking of the inited States floating drydock "Dewey" at Olongapa in the Philippines was due to an omission to closs the intake valves. Accidents of this character occa sionally occur, and one is reminded of the sinking of the "Texas" at the Brooklyn navy yard, which hap nened shortly before the Snanish American war. At her launching, the "Dewey," 500 length and 135 feet in width, was the largest floating drydock in the world She will probably be raised Intact

Asked for his opinion regarding the probabilities of the introduction in the near future of gas engines as a motive power for driving large steamships, Sir William Henry White, for many years chief constructor of the British navy, recently stated that in his opin ion the difficulty of high temperatures for the present effectually barred the way If this problem could be mastered as to its mechanical feature be possible to utilize gas engines of 20,000 b res, it might but the proposals to drive battleships with gas on "are so far only schemes."

The plan for opening a central avenue, one hund feet wide, between Fifth and Sixth avenues from Eighth to Fifty ninth streets which is being actively favored by Mayor Gaynor, would undoubtedly relieve ion on Fifth Avenue, to say nothing of providing the city with a magnificent thoroughfa through one of its most important districts. The esti-mated cost of forty million dollars, however, is proe other public improvements, such as subways, municipal buildings, and public schools, more urgent than this.

An extraordinary record was made at target practice recently by the new battleship "South Carolina," of eight 13-inch guns, which has been in commission the. Conswain J R. Edwards, 21 year old, who is in his first enlistment, made a record with the 19-inch guns in the vessel's No 4 after turret of 16 bull's eye target hits out of 16 shots in 4 minutes and 51 seconds. The hits per gun per minute for the whole 12-inch battery were 101, and 53 of 60 13-inch projectiles hit the bull's eye. Furthermore, three of the four turrets on the ship made 100 per cent of hits-

The advantages of oil over coal were illustratepa-ins a recent trip of the "Yika", one of the \$13-cap-pa-insigner advances which run between New York and Bootton The triple were on eitherstory that oil will be used exclusively on these shaps in the future. On-side of the absence of smoke form the funnals, is the complete abplitten of noise and dust fee to coul-lage. Formerly, the "Yika" bursed on a round trip \$35 time of cost, which took eight hours to get absent in future it will take only a hour for an oil berg-to gette hat. Che lishiya taplan the dishoft gallons of the which will have been dusty. The princi-gular wide, amounting to \$600 in nossis, is due to the local thair digital opisions of the work in the before tooks, where homestry forey-eight pickers were assess-ment. The advantages of oil over coal were illustrated

### ELECTRICITY.

In their tour of the Great Lakes this month, the members of the Chicago Association of Commerce will be able to keep in telephonic communication with their Chicago offices. Their steamer, the "Theodore Roosevolt," is fitted with a wireless telegraph outfit. and also with a telephone system which may be con nected with land lines at the docks where the steamer

The indirect system of illumination, which consists in casting the light of a lamp against a white surface. uch as a ceiling, and having it reflected and diffus thereby, is rapidly growing in favor. In order to make this system possible with the use of arc lamps an improved type of arc lamp has been devised by an n, in which the carbon-feeding me English concern, in which the carbon-resulting increases issue is placed below the arc. The result is virtually an inverted are lamp, and there is practically no ob-struction to the light passing upward except for the means of suspension from the ceiling

This fall the annual meeting of the Illuminating Engineering Society is to be held at Johns Hopkins Arrangements have been made for an tended course of lectures on the subject of illuminating engineering, immediately after the convention Thirty six lectures will be given from October 26th to Novem h, and facilities are provided for practical de strations and laboratory work in connection with the subjects taken up It is hoped that these lectures will result in a course of study in this branch of engineering orgraduate technical schools. It is realized that there is a scarcity of practical illuminating engineers

In Morway and Sweden the question of hydro-electric ration of power has recleved a great deal of atten tion from the fact that there are so many rivers in these countries capable of such development. Contrary to the custom in this country it is the practice in en to couple generators directly with slow speed turbines One interesting form of turbine generator consists of two whoels, the shaft of one passing through the hollow shaft of the other. The wheels turn in opposite directions, and one shaft carries the arma while the other carries the fields of the generator. This virtually amounts to doubling the speed of the gener-ator or reducing the number of poles Hydraulic thrust bearings are used At Korsnas, Sweden are four pairs of turbines on a single shaft developing are four pairs of troines on a single suart developing 420 horse-power. The fall is but six feet and the wheels make but 107 revolutions per minute. At Stangfjorden, in Norway, where there is a fall of 209 feet, a single wheel is used producing 3 100 horseet, a single wheel is used producing 3 300 horse-over running at a speed of 300 revolutions per

Mention was recently made of a continue stetho-scope and telephone relay, by which the heart heats of a patient in London could be heard in the Isle of In a paper read before the British Institute of Electrical Engineering, S G Brown the inventor described the construction of this relay 1t comprises a gap of 0 000,000,5 centimeter between platinum elec The current of a dry cell will flow across trodes. The current of a dry cell will now across this microscopic break, but any slight variations in this distance will vary, greatly, the current passing across the gap. The principal difficulty encountered was the question of preserving a gap of such micro-scopic proportions. It was evidently impossible to maintain the gap mechanically, but a system has been devised whereby the gap is automatically maintained by the current itself. Despite the delicacy of the adnt, the relay may be turned upside out affecting the gap With this relay the fluctua tions in feeble currents may be magnified twenty fold An Ulustrated description of this relay and stethoscope hitshed in next week's it AMPRICAN

The wireless telegraph station which has been re-cently erected by the French government on the Channel coast at Boulogue is of interest from the fact that it represents the first official application of the Bellini Tosi system of directed waves The new plant at Boulogue is operated by the French Postal and Telegraph department and is laid out so as to be Telegraph department and is laid out wo as to be operated either by the usual method or by the Sellini Tosi system. Accordingly the plant has an ordinary vertical antenna and an antenna for directed waves. These aerial systems are supported by four structural iron towers 155 feet high placed at the corners of a 260 feet mounter Four cables connect the tops of the towers, and the Ballini-Tosi autenna consisting of two groups of wires, is suspended from these of two groups of wires, is suspended from these factors group is formed of two vertical antenna converging towards the top, each having six parallel wires spaced il Seet apart. These antennas form a triangle with a horizontal section near the ground and two inclined wires. At the other the ground and we be specified with the advance are 300 bets again and the both advance are 300 bets again and the both advance are 300 bets again and the both advance are 300 bets again and the French stations of Salation Salation as working with the French stations of Salation Salation and Alpines posts.

### SCIENCE

Prof. Eduard Friedrich Withelm Pfueger, who died on March 17th at the age of 81, at the end of over sixty years of single-minded and unswerving devotion student of physiology, was best known to the scientific world by the 131 volumes of Pfiligers To that monumental publication many a dis ed scientist has contributed Pflüger himself nade a special study of the mechanism of spinal action made a special study of the mechanism of spinal action in the frog and the law of reflex action as studied upon the decapitated animal assons of his enricest investigations. His work on physiological consump-tion in living organisms has played an important part in our knowledge of the chemical respiration o

During the past three months the United States Weather Bureau has introduced a simplified form of ercial weather weather map, known as the 'commercial weather map,' for publication in the daily newspapers, and this now appears regularly in about forty papers This is an innovation of far reaching importance as it gives a much wider circulation to the information contained in the map than it has had heretofore While the matter is still in the experimental stage, it appears altogether probable that the newspaper maps will ultimately replace the maps now published by Weather Bureau stations throughout the country re suiting in a great saving of expense to the govern ment and the advantage to the public above mentioned

Prof Bronacher has studied the power of yohim bin to increase the flow of milk of cows and sheep The results prove that the yield of milk is increased during the administration of yohimbin, but the in crease is not sufficient to make an extensive use of solumbin as a galactogogue commercially profitable in the case of healthy animals. In the case of a row. yield of milk was diminished by an infla tion the disease was greatly mitigated by the treat ment, and an increased yield of milk followed. Many similar instances were observed. In no case did any injurious results follow the administration of the No experiments have yet been made on the influence of yohimbin as a galactogogue in the human species. In this case the question of expense is of less relative importance and the favorable results obd with animals appear to promise a s

The alloys of iron with metals other than those which enter into the composition of cast iron and steel have been little studied. In order to ascertain If any of these alloys possess useful electrical proper ties, Burgess and Aston have made a series of experi ments with alloys of iron with arsenic bismuth, and antimony The iron which they employed was ob-tained by the electrolysis of very pure Swedish iron The metals were melted together in the electric fur in a crucible of magnesia. The niloys were into bars which were subjected to various thermal treatments, and were investigated for magnetic p meability and hysteresis. The results show that the presence of antimony in iron always injures the me-chanical strength of the metal, and sometimes makes it worthless. Small quantities of arsenic improve the magnetic properties of iron and increase its electrical resistance. Bismuth produces the same effect but it must be added in larger quantities than arsenic

"The ann glows in the Lion save Sences meaning en the sun enters the sign of Leo, at the sum mer solutice the highest temperature of the year in enced We may say, on the other hand that the Babylonian astrologers thousands of years ago placed the king of beasts the flery and ferocious lion in that part of the zediac which the sun enters at the sum-mer solstice. The constellation which is called Leo bears very little resemblance to the outline of a ilon Probably the name was originally applied only to its principal star, Regulus It is to this constellation in the zodiac that we owe the countless water-spewing Hons heads, which are found in ancient and modern fountains, because in the latter part of July, while the sun is still in the sign Lee the Nile is at its highest level Furthermore the lions head with widely open jaws is in itself very suitable for the mouth of a fountain or water spout. This decorative mouth of a louncain or water spout 1 ms are oractive mostly was employed universally throughout the Greco-Roman world Lions heads are found used in the way at Athens Epheaus Ulympis Agrikentum, and countless other places It is not quite certain that this employment of the lion's head originated is Egypt, Curtius describes an Assyrian bas-relief from Bairan, showing water streaming from a ring-shaped vessel A lion stands as if on guard on either side of the fountain The water clock, which was used in judicial proceedings, bad the form of a lion and a name which means the guardian of the stream Hence the idea of protection may have been the origin of the association of lions with fountains, and this out-tom may have originated in Asia.

## THE OCEANOGRAPHIC MUSEUM AT MONAC

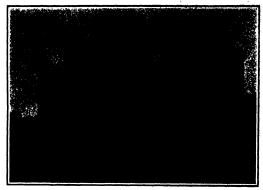

BY DR. ALFRED GRADENWITZ

The Prince of Monaco besides being the ruler of one of the smallest though most charming countries, one of the smallest though most charming courtres, has achieved fame in the world of science, has en-dowed his principality with a scientific institute unique in its kind, viz, an oceanographic museum destined to outsin not only the cormous collections brought home from his own voyages of discovery, but, generally speaking, everything relating to the investi-gation of the sea and its inhabitants, animal and

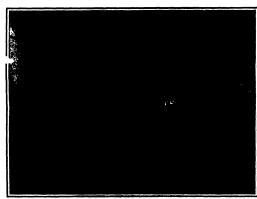

this museum which was solemnly inaugurated some works ago is situated in a site of surpassing beauty on a precipitous rock dominating the Mediter rancan, close to the famous St Martin Gardens thus rancan, close to the famous Ni Martin Gardens thus allowing of the installation of two basement stories, which up in immediately on the sea for the sake of certain scientific investigations. The foundation works of the building had obviously to be most clab orate, the more so as some of the pillars start nearly

unit, the more no no some of the pillars start nearly from the level of the new and the control of the sea. In building, 100 meters in length, is of a most imposing superance, and is a manterpleve from an arbitectural point of view Earn of its emonolith columns Nurters in bench, in 16 tons in weight Mork of the motives of devoration are derived from the frame of the ocean

When entering the ground floor, we are at first struck by the imposing mosaic floor, on which is represcrited -likewise in messic—the Princesse Alice, riant scientific cruises Everywhere around the half are seen ornamental subjects representing fis

and other inhabitants of the ocean. On both sides a monumental staircase leads up to the first floor. After passing through a huge glass-paned door, we

enter a large assembly hall, 7 meters high, adorned with four beautiful columns of Brescia limestone, from the ceiling of which is suspended in the cents an electric luster representing a medusa, whereas each of the four angles is taken up by a smaller luster forming a glass sphere adorned with long prisms reminding of sea anemones, star fishes, and other radiata in front is seen a large status of the Prince, representing him on board his yacht searching the

The western hall is set apart for lectures, wall being taken up by an artistic painting re ing the 'Princesso Alice on an intensely blue and somewhat agitated sea. The eastern hall is taken up provisionally by sundry

ections of soological subjects and ocea instruments, but is destined particularly for the col-lections brought home from the Prince's voyages, which include the rarest and most beautiful speciness. In fact, the wonderful equipment of the Princesse Alice has allowed the sea to be searched down to a depth of more than 6 000 meters, while four expeditions in Arctic districts, beyond 80 deg northern latitude, have yielded specimens of the Arctifauna, suggestive of the most interesting comparison with those of the Mediterranean and the Norther

with those of the Mediterranean and the Northern Atlantic respectively Whereas these soological collections are housed in the right hand half of the hall, the exhibits on the (Concluded on page 489)

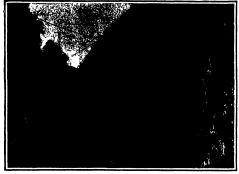

## THE NAM-TI BRIDGE

### A REMARKABLE NEW RAILWAY BRIDGE IN SOUTHERN CHINA

The Tunnan Ratiway Com The Tennian Ratiway Company is completing the construction of a line which will contect Londay, a frontier form of the French Asiatio possessions, with Tunnanou, the capital of Tunnan, and will be of great importance in developing the commerce of Indo-China and Tunkin the construction of this will have the result of the content of the result of the r The construction of this rail way through case of the next input; closed provinces of China has been greatly impeded by the climate, the difficulty of transportation and the hamman of the construction of the construction of the construction of the stream by mean of store vialuate was abandoned after few meantfactors reserved. streams by means of stone vinduculs was shandoned after a few unsatisfactory experiments, and it was decided to employ, as far as possible, steel bridges, of various types to smit local requirements, and so designed that they could be constructed in parts at the Batignolles works in Paris, forwarded to their destinations, largely by rail, as the line advanced, and quick ly put into place The bridge thrown over the Nam Ti River and the peculiar meth ods employed in its construc ogs employed in its construc-tion are here described and illustrated. At this point the river flows through a deep gorge between nearly vertical cliffs which the railway pierces by means of two curved tunnels, at a level r than 300 feet above the more than 300 feet hed of the stream of the cheem at this level of of the chasm at this level of the railway is about 220 feet. In these conditions the con-struction of a simple truss bridge of a single span would struction of a single span would bridge of a single span would have entailed much labor ex have entailed much labor ex pense and delay, owing to the necessity of working under-ground and of greatly enlarg-ing one of the tunnels in order to obtain room for the partial assembling of the heavy and deep truss re-quired. It was desirable, furthermore, to begin the conhermore, to begin the con-struction of this comparativ-ty large bridge before the railway had been artended to the gorge, in order to avoid any interruption in the prog-ress of the line Consequent-ity, owing to the entire ab-sence of wagon roads, the greater part of the account of the control of the con-greater part of the account of the mag machinery has been as on the backs of harles and on the backs of makes and men, in purcels not exceed-ing 8 feet in length or 178 pounds in weight. These con-signations determined the

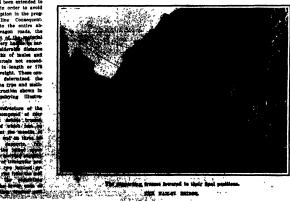

The House

Beginning the lowering of the supporting trueses

The supporting trasses lowered half-way.

on abutments constructed on on autiments constructed on artificial ledges on the walls of the gorge about 60 feet below the railway. The dis-tance between these about ments is about 180 feet but the total length of the super structure of the bridge

about 220 feet
The supporting trusses were shipped from France in parts small and light enough to be carried by men and mules, while the upper trusses, the pylons and the joint connecting the support ing trusses were sent out in eted sections of compara tively great size and weight which could be transported only by rail as it was de-signed to have the railway completed to the garge by t time the construction of the supporting trusses would be finished

The supporting trusses are attached to their abutments as they are to each other by movable joints. They we assembled in nearly vertice! assembled in nearly vertice' positions and their upper ends were subsequently to ered until they met Each of the supporting

trusses is communed of two single triangular trusses the planes of which are inclined symmetrically to the vertical at angles of 14 degrees These trusses are about 25 feet dis tant from each other at their tant from each other at their lower and outer ends and about 11 fect at their upper and inner ends. The straight bottom chord of each single truss is composed of two ver-tical plates about 2% inch liblek and 14 inches deep separated by an interval of 10 inches suitably connected and stiffened by L-bars angle plates The top chord, which forms a broken line is of similar construction but variable section, and is rein variable section, and is relu-forced show by transverse-plates about ½ fach thick. The truss is completed by pairs of light L-bars placed normally and obliquely to the bottom chord. The two single trusses of each sup-porting truss are connected by cross braces in the planes. of the normal bars and in the three planes of the bot

tom and top chords

The lower and outer and of each single trues is supor earn sings truss is sup-ported on a stone pier by means of a bill-and-socket joint of steel. The concave member of the joint is at tached to the truss the con-vex member is filted to the pier by means of a bed plate and adjusting wedges. The radius of curvature of the toint is shout 6 inches The joint is about 6 linenes. The upper and inner ends of the trusses are connected by hinge joints having pins of forged stael, 76 inches in di ameter These pins are per pendicular to the planes of the single trusses and consequently, are not horizontal but the amplitude of oscilla tion is so small that this slight inclination does not im pair the freedom of the

Although the weight of the bridge is sufficient to insure transverse stability in the strongest winds, additional resistance is given by steel

bars attached to masonry anchorages and to the rock.

The superstructure of the bridge is composed of two terminal spans 516 feet and 717 feet long, and two intermediate spans cash 482 feet in length trusses have a uniform depth of about 61/2 feet The floor beams which connect the top chords of the two single trusces are 16 inches deep and about 1/3 inch

The most interesting feature of the Nam-Ti bridge is the method by which it was creeted. Before the various parts of the supporting trusses had reached the tunnel nearest the French possessions a windlass and the could be read to be seen to be seen to be seen to be windlasses were joined together so that material suspended from the junction could be carried across the gorge by unwinding one cal winding up the other

The supporting trusses were partly assembled into a few large sections in the tunnels. These sections were then hoisted to their proper places in the trusses which were erected in a nearly vertical position and supported by the ball and socket joints at their lower ends and by temporary stays and timbers. The ter-minal section of the truss, including the socket, was minal section of the truss, including the sorker, was first placed in position on the ball of the joint, which was anchored securely to the rock. The outer halves of the upper chords with the ties and braces juty in their common plane, were next erected. The rectangular frame thus formed, which leaned against the cliff and was also stayed by ropes and timbers was then attached to the interior of the tunnel by two tackles strong enough to prevent it from being dragged forward by the weight and leverage of the remaining forward by the weight that overlage of its estimation parts as they were added, and to maintain the completed truss in its vertical position. This frame then served as a scaffold for the assemblage of the bottom chords of the truss and their attachments. In this cettion of the trues the bars which are perpendicular to the bottom chords were so nearly horiz they formed convenient supports for the few planks on which the workmen stood. After the bottom of the truss had been completed the inner halves of the top chords were assembled in the same manner some of their auxiliary parts being temporarily omitted in of their auxiliary parts being (emperarily omitted in order to lighten the lance end of the truss. The parts were temperarily joined by means of lather turned boils in order to seu the erreated possible preclaim, but the construction of the supporting trusses was not in advance of that of the railway that it was found possible to evidace most of the the by rivets before the truck that description. So the congorge Meanwhile in order to save time, a file of coolies, marching five feet apart, carried through the tortuous mountain passos for more than 12 miles, the two heavy chains, each

900 feet long, which were employed in lowering the supporting trusses to their final positions The other achinery required for this purpose, as well as the sections of the upper table of the bridge, was brought by rail

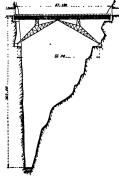

The lowering was ac complished by means of two great pulley blocks suchored to the face of the cliff above the tunnels and con nected by the two long chains with two simi lar blocks attached to the upper ends of the Thechains trueses were first drawn taut in order to slacken the temporary tackles at tached to the interior of the tunnels and allo their removal The chains were then slowly paid out, by means of windlasses provided with brakes, allowing the two trusses to turn around their outer ends

bascule drawbridge, until their inner ends came to-gether In order to facilitate this operation, both trusses carried sights at their inner end, and one of

trusses carried sights at their inner and, and ones of them, which was lowered a little after the other, hore both parts of the hinge joints by which the trusses were to be commonded. The omitted parts of the trusses were then added, a bed plats was conserved over their junction, and a pyton, which had been party assembled in frames of two peaks, which had been party assembled in frames of two peaks, which had been party assembled in frames

### Scientific American

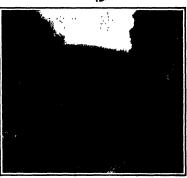

The upper table of the bridge was as continuous trues, in a straight and not very long ex-cavation in the first tunnel. As its construction pro-gressed it was moved forward with the aid of rollers greased at was moved forward with use ald of rousers placed on the two pylons and the junction of the supporting trosses until it had been completed and its forward end had reached its abutment on the opposite side of the gorge. The connections between the four spans were then removed. The construction of the bridge was commenced in March, 1908, and was

dy of the D

terpretation of the ch The physical in in the lines of the solar spe in the times of the source special position weather conditions shad by peasing from one to sandher point of the sun's disk, is still under discussion. Whilt-laker reques to attack any definits significance to changes of temperature occurring in the stormy solar atmosphere, nor does he admit that the peculiarities of spark spectra are characteristic of elevated temperaof spars spectra are characteristic of elevated tempera-tures. Electric Privation of alone may be excited in a coid gas, as is proved by the aurors. Whittaker at-tributes the observed changes in the spectrum to great pressure. On the contraction of the spectrum to great pressure, the contraction of the spectrum to great defend the usual interpretation, which attributes the changes to Jight temperature, radial velocity and the chemical action. Everyhelder, and admit that pre-sures much greater than atmospheric case that the sure much greater than atmospheric case after the sun, even at the bottom of the roses as greater. This epinion is based upon the sharpness of spectral lines in general But the hypothesis implies that in the sun

in general stat the hypothesis implies that in the sus prayitation is everywhere opposed by repulsive forces. Until recently the spectro-hellograph was applied chiefly to the lines H and K. Thus were obtained images of the floculi, those bright clouds of calcium images of the nocculi, those bright clouds of calcium vapor which almost cover the sites of the spots and faculs. Since 1908, following the example of Hale, the red line of hydrogen, which shows entirely differ-ent forms, has also been employed. This has led to the discovery of long dark diaments, which normally permist for several weeks, but which sometimes dissppear or change rapidly near very active spots Ac-cording to Designdres these filaments represent torus They are cially by the middle part of the line H a, which corresponds to the upper limit of hydrogen vapor marginal portions of the same line show dark fic

which are reversals of the calcium flocculi The photographs made by Hale, at Mt Wilson, with this same line, show the spots surrounded by cyclonic structures, which exhibit opposits rotations in the north and south hemispheres These spirals are far north and south hemispheres These spirals ar less frequently observed in ordinary photographs they be trajectories of material particles. The first evidence, furnished by Hale, consists in the doubling and the polarization of the spectral lines in the intere spots These phenomena suggest the circulation of electrified matter in a magnetic fie shed sought further evidence by placing the slit of the spectroscope across a spot near the sun's limb. In the spectros this case radial velocities in opposite direction ns should Instead of this he found on opposite sides of the spot however. Evershed found numerous and persistent indications of a tangential movement, always directed These results were obfrom the center of the spot tained chiefly with the lines of iron Possibly both

> different levels, the whirlwinds in a stra tum of hydrogen, the centrifugal flow in me tallic vapors beneath

Beechi, who discov-ered that the dark lines of the solar spectrum ome bright or versed in a narrow stra-tum at the base of the chromosphere during a total eclipse, contended that this reversal could rved at ordinary times Hale and Ada have confirmed his view by photographing reversed spectrum Their success appears to be due to the very delicate adjust ments which enabled them to keep the alit of the spectroscope accurately tangent to the sun's . The wave lengths of 184 of the lines were measured and wore found exactly equal to those of the corre ing tark lines of the erdinary spectrum. This perfect agreement could not be expected if, as

One of the supporting true as erected, in a verti

Julius suggested, the bright lines are due to the light of the photosphere, affected by anomalous dissertion.

To blacken light woods make a propersions of an ounce of hours, dissolved in a guart of water, with two connecs of sankins. The legal is then to be belief until a perfect isolation to obtained, clean salt; in you components of giventra, and complete by delighe a sufficiency of orbits sufficient black to assigned output the shade, which will you be belief or pro-ceived.

rect. The "granny' knot would be upsafe for the serious use to which it would be subjected in case of We therefore publish the foregoing diagram in order to correct any liability to mistake -Europ 1

### New Cometary The

Neither the comets seen for the first time in 1909, nor the periodic comets of Perrine and Winnerke which reappeared nearly in their computed places, offers any special interest Halley's comet reappeared in the position calculated by Cowell and Crommelin It was first detected in a photograph made by Wolf, at Heldelrg, on Septemb er 11th but was subsequently found on a plate exposed by Keeling on August 24th brightness increased slowly until the end of the vest its spectrum, first observed in December, showed the absorption bands of nitrogen and cyanogen, with inditions of self luminosity due to incandescent gases.

The past year is marked especially by the results

of the retrospective study of the spectroscopic and direct photographs of Morehouse's comet (1908 C). ves barely visible to the naked ove This com exhibited several divergent bright tails accompanied exhibited governl divergent bright talls accompanied by streamers darber than the sky, as if the space surrounding the conset were filled with luminous matter Shosequently, the tails bent and crossed, and Melotte observed a diminution of brightness at the point of intersection, as if one stall absorbed the light of the other Several times the tall appeared to break up into incide, which formed new surepopes and moved away from the head with increasing valority Comf successive photographs showed that tail opened and closed as if the whole sta

ture were rotating about a central axis. The stereo-scopic combinations made by Barnard appear to indicate the presence of talls of helical form, but Barnard suggests that this effect may be due to changes of form in the intervals between exposures. Crommelin observes that the apparent rotation of the talls may also be an illusion. It is sufficient to suppose that the head rotates slowly and projects particles rapidly in a plane which follows the rotation If the tails repre-sent the trajectories of particles, forces emanating from the head and from other points must co-operate with solar attraction and repulsion. The occurrence of four successive outbursts of activity sugg influence of a medium of variable constitution, formed by particles ejected by the sun and made visible by sage of comets, either by electrification or by the nar the passage of comest, either by electrification or by starying competary matter with them. This hypothe-sis would explain the presence of cyanogen and cer-tain other lines in the spectra of nearly all comets for this theory the apparent boundary of a comet's tail like that of a flame, would be simply the locus of a change of physical state

In the spectrum of this comet, E (' Pickering found tion bands corresponding to the principal lines of hydrogen At Meudon and Juvissy a faint con-tinuous spectrum indicating self-luminosity, was ob-served Designders regards the three pairs of bands as doubles, due to the Doppler effect and deduces for the cometary matter a velocity of more than 1,200 miles per second but the presence of a strong single line in addition, leads Campbell and Albrecht to resect this interpretation

### The Current Supplement.

A thoughtful yet popularly written article on Hered-ity by Prof W E Castle of Harvard University opens the current Supplement No 1797 The article shows that before any serious attempt can be made to im prove the human race considered as an assemblage of animals possessed of certain desirable physical and intellectual attributes it is obvious that we must know something about heredity in general and how, in pa ticular each of the desired physical and intellectual attributes is produced. In his article he reviews briefly some of the problems which the study of hered ity presents and some of the results obtained from their consideration —Sir William Crawford concludes his excellent consideration of Irish linens and their manufacture -Shelise or lac is one of those aids to civilization about which there has tended to (IVII) alton shout which there has reduce to be an almosphere of mystery and romance. Mr G Clarke Nugent removes much of this mystery in a strictly velentific account of sheliac and the lac industry—A Roce's instructive article on how to build a profile account the second of the se puppet show is concluded -A critical consideration of the Mailet locomotive in service is published—The chemical regulation of the processes of the body by means of activators, kinases, and hormones is dis-William H Howell of Johns Hopkins University —Mr William E Starks paper on Measuring Instruments of Long Ago is concluded —We are very apt to regard the tail of an animal as merely "the other end" of the body but Nature seems to early esteemed the member highly and to have made it her most efficient instrument of locomotion rious facts about these uses of talks are described by Mr James Newton Baskett-Mr W F Denning marizes our knowledge of the planet Mercury The usual Electrical Notes Engineering Notes and Trade Notes will be found in their accustomed places

Biostruction is Ascenantian as the University of Paris.

A Chair of Accentation has been established at the University of Paris by M. Beell Scharcel, and is considered by Prof. Marchis, who has announced the programms of this course of sectures. The professor being by replying to the criticium that M Zaharcel's endowment would have been employed far more unfully for the development of certain averagation if some direct accommynament had been given to constructors. who are compelled to make very costly researches, to the brave aeronauts who risk their lives in the to the brave aeronants who risk their lives in these agregations. The ampirician which necessarily rules in the beginning of every industry should now be superseded by a methodical and rational interpreta-tion of observed facts. The object of this lecture course will be to expound as logically as possible the results which can fairly be considered as certain. Without extering into very record to theoretical con-Without entering into very recondite theoretical con-siderations, the lectures will still be far from "popu-lar" or elementary Finally, the development of the special seronautic library already possessed by the University, and the formation of a collection of small models of seroplanes and dirigible balloons, will supement the instruction given by the lectu professor will not confine his attention to theoretical professor will not confine his attention to theoretical speculations and laboratory researches, but will fol-low in dotall the experiments of constructors and the trial flights of aviators, noting in each case the prog-ross achieved and endeavoring to account for the

### Selenting American Prizes for Inventors

The SURVIVIC AMPRICAY offers \$100 in three prizes, to be awarded to the inventor who gives the best account of how he conceived his invention, how developed it in actual practice, and how he succeeded in selling it This sum of \$100 to be distributed as follows \$50 to the best account, \$35 to the second best account, \$15 to the third best account.

neer account, all to the third ower account.

There is no limitation as to subject matter of the invention In other words, the invention may be a household utensil, a game, a piece of electrical apparatus, an improvement in railway construction, a metal lurgical process, etc. The following conditions, h ever, must be observed

1 The invention must be patented

inventor must have actually sold his patent, and the invention must have been commercially in-

3 The account of the inventor's success must not be onger than 800 words.

4 The composition, letter, or article must be type-

written on one side of the paper only
5 The inventor must sign his offering with a pe

donym, and inclose it in a sealed envelope, upon which the pseudonym is written. A second sealed envelope must be provided, bearing on the outside the pseumym under which the offering is su mitted, and taining the real name and address of the contestant 6 Contestants must address their offerings to Inve-

tors' Prize Editor, Scientific American 361 Broad way. New York city 7 The contest remains open until August 15th, 1910

Judges will select the essays which, in their opinion, have won the three prizes and give them to the Editor have won the three prizes and give them to the Editor of the Schwitzir Alwait, and, with thereupon open the sealed envelopes containing the true names of the contestants, and notify the winners of the prizes.

8 The Editor of the Schwitzir Akmanan has the

right to publish the prize winning articles or letters

as well as those which may not receive prises
9 Unsuccessful letters cannot be returned It is
thereupon urged that the contestants preserve copies of their contributions

## THE ALBANY-NEW YORK AEROPLANE FLIG

### HOW CURTISS COMPLTED FOR THE SCIENTIFIC AMERICAN TROPHY AND THE NEW YORK WORLD PRIZE

If the three attempts that have been made to fly from New York to Albany, or the person, first two were made last fall by dirigible balloons, and were unsuccessful, while the cently by an scroplane, and resulted in a brilliant prisewinning flight.

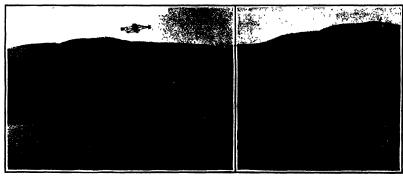

After making a number of flights over Lake Kenka, at Hammondsport, N. Y. and landing successfully upon the water, Mr Curties shipped his aeroplane to Albany and took a prespecting trip on the steambest from the capital to the metropolis. He found practically no suitable landing places on the river banks throughout the entire journey At Poughkeepsie, however, a mile back from the east shore, he selected a landing place on the farm of Mr W F. Gill Upon reaching New York Mr Curtiss gave notice that he would attempt to win the cash prise of the World state also the Somertruo Asimsona Trophy for the third consecutive time, which would give him the sup per-manently. He then returned to Albany to superistend mannuy. He cam recursed to annuy to supervisees the assembling of his hiphane. This was secondlikely in a test pitched upon Yan Renneclear Island, a mile south of the railroad bridge at Albany. A heavy rain caused delay in assembling the hiphane and kept the aviator from starting on Thursday, May 1862, while Priday the flight was impossible of accomplish-

the New York World, which so generously donated a prize of \$10,000 last summer for the per formance of this feat dur iornance of this feat dur-ing the Hudson Fulton cclebration afterward ex-tended the time within which it could be compet ed for to October 10th, 1910 Only a few weeks also after the exciting acropiane race of Paulhan and White from London to Manchester England, for the \$50,000 prize of the London Daily Mail It was decided to amend the rules and permit the mak-ing of two stops es route, while the time limit for the completion of the trip was set at 24 hours Ая soon as the modifications were announced, Glenn II.

Just before the start at Albany.

ment because of strong ment because of strong wind Early Saturday morning Mr. Curtiss went to the island. Everything to the island. Everything was in readiness for the flight, and the weather appeared to be perfect, but just as the aviator was about to start a wind sprang up, and he was obliged to again postpous. his attempt. Sunday morn-ing dawned bright and clear without any signs of wind, and after waiting till 7 A. M. to see if the wind would increase, Mr Curties started three minutes thereafter Circling to the north so as to pass within the city limits of Albany just below the railroad bridge, the aviator headed down the river at a 50 mile clip against a wind

The biplane passing over long Island, the government explosives manufactory.

Curtiss planing down the Hudson at 50 miles an hour.

Curtiss, the first winner of the Bennett cup race in France last year and twice the winner of the Scine tier AMERICAN Trophy, began experiments with a new and powerful biplane at Hammondsport N Y, with regard to landing upon water ite had al ready experimented last fall upon rising from the able to accomplish this. had attained a speed of 20 miles an hour with his small biplane resting on pontoons and daiven air propeller and 25 horse. power 4-cylinder Curtiss aeronautic motor It was therefore a comparatively casy matter to fit his new and larger biplane with cylindrical floats and an air tight canvas bag run ning the length of the wood strut that connects

THE ALBANT-NEW YORK ASSESSMENT PLANTS.

of 4 or 5 miles an h velocity He rose quite rapidly to a height of 1,000 feet, and followed the course of the river for 75 miles to Poughk As he came in sight of the As he came in sight of the railway bridge at this point, he was flying at an clavation of about 500 feet. He increased his height nomewhat as he neared this \$13-foothigh struc-ture, which he passed sev-eral hundred feet spens.

n, roro cie. After he and all, in order to re-jet, the tanks of his me before continuing althted a stop of one hour At 9:36 A. M. he re-started At 9:36 A. M. he restarted on his eventful flight and, souring out over the river, he headed toward New

York at a somewhat slower gait than before, owing to the curves and wind. During the balance of the er gait than before, owing journey, he maintained a height of from 500 to 800 feet. He did not fly as high as during the first part. since, in passing through the Highlands, he found that it was better to fly at a lower elevation Upon reaching Newburg Mr. Curtiss could see from the smoke that the wind had changed and was blowing from the west, or directly across his course. As the city was not great, however, this did not cause

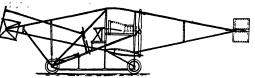

him any unearloses.

Som after passing Storm King, the 1,330-foot mountain that juts out into the river just above West
Point, the daring aviator experienced a sudden down
draft of air that caused the machine to drop so rapdeath of air that cannot the machine to drop so rap-ily that it seemed to fall away beneath him At the same time, it dipped at a sharp angle to one side, owing to one end catching more of the downward current. With great presence of mind Mr Curtiss directed his front horizontal radder sharply down directed his front horizontal radder sharply down which, of course, they were not when in a current of air traveling perpendicular to them This maneuer was seconsaftly, and he was able to right the machine Save for this once, he had no thrilling experiences the passed over found in the control of the course of the passed over found in the course of the course of the trip he followed the middle of the river. If of his trip he followed the middle of the river He made a practice, however, of keeping to the lesward side of the river as much as possible Thus, when Peckskill was reached, and he found that the wind had again shifted so that it was blowing from the receiting was researce, and he bound that the wind-ban sagain altitude that it would not a the wind-ban sagain altitude that it was always allo, and tol-lowed file altitude to always allo, and tol-lowed file altitude to the plant of the same of the to-source for a short distance in order to land upon to the was somewhat amased, upon landing, to find that what had appeared from his condestrable height to be level ground, was in resulty a fairly steep incline, so that it was necessary for him to jump out of his ma-chine the moment it came to a standardit, and to held it from sidings back from the hill. Alterward, when where there was a sharp terrace, and after making a stop of over an hour, he started off this terrace at a vory short run. The machine sourced of the terrace without dropping to any great extent, showing the possibilities of starting from a cilif Mr Curtiler's second stop was occasioned by the dis-

possibilities of starting from a cilif Mr Curtisa's second stop was occasioned by the dis covery that his lubricating oil was almost gone By landing upon the north end of Manhattan Island, be would accomplish the flight from Albany to New York insiding upon the north end of Manhattan Island, be would accomplish the flight from Albany to New York with but one stop, while two were allowed. Therefore, so as to make sure of winning the presence of the state of the speed was, over the course followed, 53% miles, so that the speed was, dys miles an hour The remained in this second state being made at 11 d 3 M makes, the state of the other the order of the state o

than those that were actu-ally used, which were about 7 inches in diameand 7 feet in length in several of the photo graphs, showing the bi plane in flight, these floats can be seen projecting from the back of the lower plane Together with the plane Together with the air inflated bag streeted along the lower runner, they had sufficient buoy ancy to keep the machine

from sinking should Mr Curtiss have been compelled from slaking snouth Mr Curtiss have been compelled to alight in the Hudson. An examination of his ma-chine showed that the oil tank had sprung a leak and had he not had an indicating gage constantly le-fore him he would not have known that his supply was rapidly diminishing, and thus he might have had

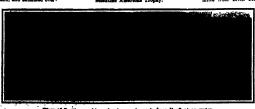

The biplane with which Mr Curtiss accomplished his epoch-making flight is very similar to the machine with which he won the Bennett Cup last fail at Rheims. It differs from the latter in having some-Aneims. It divers from the latter in having some-what larger rudders and balancing planes, and also in the extension of the upper plane 30 inches boyond the lower plane at each end of the machine. This differential plane idea was first tried a short time ago by Henry Farman, and was embodied in the machine used by Paulhan in his flight from London to Man chester it tends to give the aeroplane a certain amount of inherent transverse stability. The total supporting surface in the main planes is 236 square supporting surrace in the main planes is 2.56 equire feet, and the weight of the machine complete is 950 pounds including aviator full and oil As a re-sult of this the weight carried per squar foot of supporting surface is 402 pounds. This means that the machine must travel at a speed of 40 miles an hour along the ground before it will lift in order to attain this speed, a powerful 8-cylin der motor of 90 horse-power is used. The 7 foot diam eter, 8 foot pitch propeller mounted upon the engine ster, a foot pitch propetter mounted upon the engine crankshaft makes 1,100 R PM while the machine is in flight, and gives a pull, when the machine is held stationary on the ground, of over 300 pounds. This is, we believe somewhat better than the thrust obtained from the Gnome 50-horse-power motor used by Farman and others in their seroplanes The longest flight which Mr. Curtiss had formerly

made with his new biplane was a flight of 38 minutes duration above Lake Keuka at Hammondsport, N Y, in his try-outs of the machine. The greatest care was taken in re-assembling the machine at Van Rensselaer taken in r-assembling the machine at Van Mensenser Island, to see that all nuts were projectly washered, cotter pinned, and covered with varnish, so that they would not work loose Bome idea of the strains that must be undergone by a machine in flight can be had when one learns that Mr Curtise's bipliane was said. dealy dropped 40 to 50 feet while in flight, by downward current of air mentioned, and then quickly made to support itself again by a dive of considerably eater length. One reason for the success that the Curtiss machine has met with is undoubtedly the and strong manner in which it is put tog-taer. There and arong manner in which it is put by the are no bent struts and loose guy wires, such as we have noted in one of the well known foreign biplanes that was recently brought to this country, but every thing is put together in a thoroughly workmanlike manner, and consequently there have been no acci

In making his great flight, Mr Curtiss also com In making his great night, Mr. Curtass also com-peted for the Silverinic Austra A. Trophy, which is to be awarded this year for the longest cross-country slight. The first record for 1910 therefore stands at 74% miles but it is probable that this will be length ened considerably before the end of the year

The average speed made by Mr Curtiss from start to finish of his flight from Albany to Manhattan Island — 1 distance over the course followed of 128 miles—was 50% miles an hour Including the final leg of 14% miles from 207th Street and the Hudson Riv

Governor a Island (142% miles) this average falls to 49 14 miles an hour The actual air line distance be-tween the starting and finishing points is 13634 miles, so that using this as a basis, the average speed from point to point was but 4701 miles an was but 4701 miles an hour, which is the same as Mr. Curtiss averaged in the Bettiett Cup race at Rheims. As he no doubt covered more than 136 1 3 miles, it seems his new machine is faster than the Rheims racer with which Hamilton is making flights

View of Curties machine showing posteons to keep it alloat on water.

. THE ALBANY-WHY TORK ARROPLANS PLICET.

### An Aurial Torpedo.

One of the most remarkable demo natrations of the s of 'wireless has been made in London possibilities of 'wireless has been made in London last month, when Mr Thomas Raymond Phillips a Liverpool engineer, conducted a series of experiments on a small scale with a dirigible balloon entirely manipulated and controlled from the earth These tests were made at the Hippodrome one of London's tracest theaters M Phillips employed a dirigible on the line of the Zeppelin but only 20 feet long The model complete weighted about ten pounds and the serosint was filled with hydrogen

During the demonstration the inventor stood on the stage of the theater while his machine maneuvered about over the auditorium. He had by his side a keyboard semething like that of a typewriter but rath larger, and in reality composed of a number of push switches, above this was a small transmitter similar to that used in ordinary wireless telegraphy mercly pressing the keys Mr Phillips she ed that he could make his dirigible do anything he liked would press a switch over and the machine would promptly rise, the actuation of another key would produce a descrit Forward and backward motion was also obtained with perfect certainty as well as

circular flights and point to-point voyages which involved very in tricute steering. The experiments lasted some hours but never once did the model fail to do what the inventor had announced it was The most effective demonstration however, was that in which the uses of such a ma chine in warfare were shown The car of the dirigible had a trap door floor under the control of door noor unner the control of the operator who after maneuv ering the machino over a certain spot, opened a switch which caused the trapdoor to open and allowed a number of namer lumbs

The mechanism of the invention is extremely simple and one that could be made purfectly re-In the car of the balloon are a number of coherers suited to different electric wave lengths, and these control small switches and these control small switches which put into and throw out of action two sets of propiliers the trapdoor, and the system of lamps whereby the sirship can be lit up when desired. The secumulators for working the propellers and lighting the lamps are car ried in the car. The directional control of the airship is effected in a horizontal plane by a pair of propellers hung out from each e car on outriggers simi lar to those of the 'Zeppelin Either or both of these can be driven, and they can also be reersed (ither singl) or together so that the machine can be steered to the right and to the left kept in a straight course, or reversed back in its own tracks without turning round

Two horizontal propellers our siderably smaller than the driv ing screws are also attached by iggers to the nacelle,' and provide the means

for control in a vertical plane. The machine is so balanced as to be approximately equal in weight to the air it displaces consequently, when the horizontal propellers are not working it neither rises but can be made to ascend or discend by putting then in motion. Thus by using one vertical propeller an the horizontal ones the machine can be caused to more in a spiral path, and by cutting out the vertical s it can be made to rise straight up

The switches whereby the machine is controlled after the wave length of the electricity produced at the transmitter, all the coherer switch ship being tuned to different wave lengths.

The demonstrations have been so successful that the British War Office have investigated the matter, and it is understood that they have taken the invention up. At any rate trials with a full sized machine ar shortly to be made and if these are successful the invention will be bought by the government. The dimensions of the full sized war machine will be 60 feet long and 6 feet in diameter, and it will be capable of carrying nearly a couple of hundredweight of ex-plosives while its radius of action will be well over 100 miles Its speed will be about thirty miles p

### MR. EDWIN COULD OFFERS \$15,000 TO THE SUCCESSFUL DESIGNER AND DEMONSTRATOR OF A SAFE MEAVIER-THAN-AIR FLYING MA-CHINE EQUIPPED WITH MORE THAN ONE MOTOR AND MORE THAN ONE PROPELLER.

The fac-simile letter of Mr Edwin Gould, printed on this page, in which \$15,000 is offered for the best successful heavier-than-air flying machine, driven by more than one motor and one propeller, speaks for it It may be pointed out, however, that Mr Gould. ering his prise, has been moved by other con siderations than those involved in a sporting contest. Races, long-distance flights, speed tests, and other record breaking performances, have no doubt done much to bring the flying machine prominently before much to bring ton ping maschine promisently better the public, but it must be admitted that, besides whet-ting the natural human appetite for competition and driving home the truth that the flying machine is destined to play an important part in future human

It is Mr Gould's primary intention to furth naulic invention and with that end in view he offers a prize not for the fastest flying machine, but for a Receipt hinds of the bun.

The six ear be statled with comparative case out by the possessors of small infeccess, consequently the announced theoretics, are numerous; but astronome are constantly placing their chief reliance on the statled

cal results of pre ciae mes and long-continued observations, and they do not accept the physical theories advanced until after a accept the payanean incorress extended which nave been admitted and used for many years are not exempt from criticism. Thus, the elements of the sun's rotation determined by Carrington fifty years ago, which are still used in the reduction of the photographs taken daily at the English observatories, have been cancer can't at the angulan observatories, have been called into question. Turner has examined the measurements made by Peters between 1860 and 1887, which all the gap between Carrington's work and the Communical Advances. which all the gap between Carriagon's work and the Greewich photographs. He reaches the supprising conclusion that the sun spots of the northern and southern hemispheres revolves about two different axes, which make with each other an angle of 8 min-tise. The spots appear to be affected by a general drift which changed direction about 1385. The hypothesis of a placetary influence on sun

The hypothesis of a planetary influence on sur-spots has been often discussed and generally rejected In its favor, however, may be cited the proved fact

that the last maximum in the number of spots which was an-nounced for 1905, was delayed nearly two years, and that this retardation had been predicted by Brown as a consequence of motions of Jupiter and Saturn

lar activity gradually ed in 1909, as had been experted Nevertheless, a group of spots remained visible from Noember, 1908 to April, 1909 group which appeared in Scotem ber 1908, was found to be con-nected with a violent magnetic storm Lockyer's photographs made with the spectroheliograph, show that the principal spot was gradually obliterated by clouds of calcium which exhibited a cyclonic fore the structure thirty hours be maximum of magnetic disturb-ance Mitchie Smith observed that an extraordinary outburst of activ ty in the same spot was quickly followed by violent and projonged agitation of the magnetic nee This group of spots affected the earth's magnetism in four su cessive revolutions, in two which it produced two distr ances at intervals of five days This fact suggests the influence of two limited and divergent beams analogous to the double talls of certain comets.

intervals of 27 or 28 days, is well established for magnetic storms and aurors: The question has and aurorm been asked whether other terres trial phenomena do not similarly show the influence of the sun's rotation From the reco cyclones in the Indian Ocean, Maunder finds that an interval of

28 days is of common occurrence The first results of the total ecl'pse of 1908 have been pub-

lished. The report of MacCloan's expedition may that the corona exhibited the character, usual at intern ate epochs, of great extent in the middle latitudes, but that it was distinguished by certain features from all previously observed coronas. The coronal rays or streamers showed no connection with the protuber-

New York City.

Deer Stri-

In order to promote progress in aviation, I offer through the Scientific American, a prize of \$15,000, which is to be given to the inventor who designs and demonstrates in this country the best heavier-than-air flying machine equipped with more than one propeller and with more than one independent motor, in such manner,

that the motors can be operated together or independently.

My objet on offering the prize is to encourage the invention of a heavier-than-air flying machine which will be able to continue in safety on its course, even though one of the driving devices should break down.

In order that the efficiency of the inventions may be thoroughly tested, it will be necessary to subject them to endurance tests of stipulated length of time or distance.

Full conditions governing the award of the prise will be announced in a later issue of the Scientific American,

very trus yours, lain Touth

MR. EDWIN GOULD'S OFFER OF A \$15,000 AVIATION PRIES

type of flying machine which has thus far not been constructed Absolute safety must certainly be attained before a flying machine can over become even a popular vehicle of pleasure, and the attainment of safety is the chief object which Mr Gould has in view The conditions which will govern the novel contest

which will be inaugurated by Mr Gould's magnificent offer have not been decided upon as yet. They will require deliberation It is hardly likely that we shall he able to publish them for three or four weeks. In the meanwhile, the Editor will gladly consider any suggestions which the readers of this journal may make so that conditions may be drawn which will be fair and which will best serve the object of the prise.

Kinetic energy is the power stored in a moving ob ject which keeps it in motion By way of illustry conceive a railway train rushing along a straight, level stretch of track, the train being driven to its power stretch of track, the train being driven to its power limit if the source of power, say the steam pressure, is now suddenly removed by closing the throttle, the train will continue to run or "coust," for a long dis-tance, due to its kinetic energy, gradually reducing in speed until the energy is exhausted and the train

The United States during February produced pig iron at a rate which equaled 31,650,000 gross tons per annum During January the rate was about 31, 000,000 tons, and in December about 31,450,000 tens. 000,000 tons, and in December about 31,450,000 tens. In commenting on these figures, the Iron Age considers it is questionable whether the February rate will be maintained during March, since the daily on pacity of cole and anthractic furnaces is use at the pacity of colo and anthractic furnaces in use at the septiming of the month was fisht tom, whereas the daily rate of production for Pedromary was shifts from: "It is hard to realize," the journal remarks, "that in February the production was more than 40 per obte above that of Pedromary of Lat year, and nearly 3.73 times that of Pedromary two years ago, and yet that no little metal is presente on the market. It is not surprising that a question in ruised of the shift for of the country to showed ping two, at the present rate throughout the years."

## DR. ROBERT KOCH, THE FATHER OF PREVENTIVE MEDICINE

BY JOHN B. HUBER, A.M., M.D.

Dr Robert Koch died on May 17th list. To estimate the value of his work, we must consider how humanity suffered from disease before his time Before the beneficent inoculations of Jenner, ep-

suffered from disease before his time
Before the beneficant incontinuous of Jenner, epdemics of smallpox devastated wat regions, decimating
cities and wiping out whole towns and villages, hashy
every wayfarer one met was a pock-marked servivor
red devadrability. To go no further back—an
epidemic of it was the last of those seren plagues that
afficted Egypt. Those 50,000 larselities and Philistimes at 38th-58mens, and those 70,000 others were
destroyed by the microscopic Beofities pestis Before
and since the Trojan war (in which this germ did its
greatest execution), throughout the middle ages, and
indeed up to our time, scores

indeed up to our time, scores of epidemies of the bubonic plague have wrought ghastly havoc One of these, the Black Death of the fourteenth entury, destroyed most miserably (so Gibbon computed) one-fourth the population of the then known world

the state of the s

Consider finally tubercu losis - consumption - which has probably always afflicted mankind At any rate Hip-pocrates twenty two centuries are wrote of it as the disease the most suffering and the greatest number of deaths The dreadful infections here mentioned, though more grue somely picturesque in their ravages, have been dwarfed by consumption. In the nineteenth century fourteen mil lions died in war, by bullet and steel and camp diseases during the same period thirty millions succumbed to consumption From time immemorial every third or fourth adult—in some communities every other adult— has succumbed to insidious phthisis We whites have in-troduced this disease among negro "brethren," who die of it in greater numbers than we do, and among our India: "wards" who are fast disar

postring by reason of our the borelooks, added and aborted by our "five water." Who has not, either in his family or among his friends, had to sudure some experience of the "Great White Flagues"? Think of it! Between adolescence and the first/dith; year, in those years when young me and young woman contemplate marriage, when wives should be strong to multitain their homes, when we should be strong to multitain their homes, when we should be strong to do the world's work. In those most previous years tubercelosis has throughout to conturned head calabating every first of fourth of tour conturned the state of the strong the strong of the strong the strong of the strong the strong of the strong o

factor as it had been a death dealing infection, every year our nation alone has been sustaining by reason of it a monetary loss of more than a thousand millions of dealers.

Reflect upon all these things, and then turn the mind to the year of Koch's birth—1843 In that year Pasteur entered the university

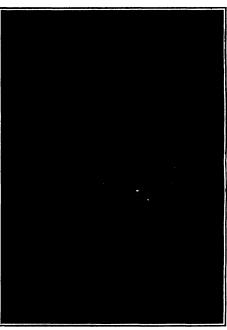

And let us premise here that in science great names have relandmarks, and the owners of these names have traversed and gisaned in the fields where many advoted and how forgotten laborer has delwed and sown and perhaps sweated blood. It should indeed, be comfortable observation that in sevence at least no man works in vain Full many a one has given his whole lift for establishing a fact, or indeed only an

of the earth, Koch clearly demonstrated how this business was to be gone about. When Koch was seventoen he persuaded his father

When Koch was seventoen be persuaded his father to get him a mirrescope Pussessed of this most congenital companion, he set about perferring other tochrical means of investigation For even gentle cannot work effectively without good tools. After at taking his decentrate in medicine he because a simple country dector, utilizing the time whith—nourrind to exceed the set of 
deeried, yet it is amaxing how frequently gentus, burn ing unquenchably in the service of humankind has man aged to get along without them, how they never avail at all in the absence of the right man.

But soon the German government became cognizant of Kochs writings. That government recognises good work; it avails itself of ability, it ongaged Koch in its service

It 1882 came his truly ochal discovery of the tubercle bacillus, the ess tial cause of tuberculosis Here was laid down the sure and scientific busis of the anti tuberculosis propaganda which has since been so suc cessfully waging Upon this measures intelligently formu lated and with wonderful result up to our day In Prus sia (Koch s own country) the consumption mortality been reduced forty per cent, in Boston, forty five per cent. in New York city fifty per cent in our northern (illes twenty per cent in the years of 1901-6. And it is being confidently predicted on the basis of the prophylaxis thus far achieved that our chil dren—ves, even we in this generation—may see this dreadful scourge of the cen turies all but eliminated from human experience Koch elaborated various tubercu-lins diagnostic of tuberculosis, their curative properties have unfortunately proved disappointing yet they were the basis of the derfully effective anti toxing of diphtheria, telanus (the most agentzing of all diseases of which formerly nearly all the sufferers died) meningitis pneumonia, and other dreadful infections

DR. ROBERT KOCK

them to a feet, his inclusity unrecognized, ridicule and even persecution oftentizes his most compensation, the many recognization of the particular description, yet his life and his works have been absolutely essential to the universal scheme. There is the human unit, and there is the welfare and the very existence of the work. Which latter were impossible without the self absent ing labors of the individual. Nor does it in any wise detract from the gratitude due the great man, that he had profited by the labors

Nor does it in any wise detrect from the gratitude due the great man, that he hat profitted by the labors of others, adding what he can of his own, scruliniting every detailed datum in the whole fabric permeating and illuminating it with his own mind, and extracting from the mass the mighty deductions of genius. Thus did Jenner's inoculations, upon the principle of fight ing flav with fire, maste clear the way for Davision and Laiser and Pasteur, upon whose subtructures Koch built. These latter developed the germ theory of disease, Koch made of this theory the science of bacteriogs, which is bady the most potent factor in civiliastices. Pasteur declared it to be within human power to hands all parasticle diseases from the face

And Koch s achievements in tuberculosis were only a

part of his service to maintind. In 1888 he discovered he cholers have fullers which in responsible for that disease. In the investigation of other words our greaters amove bubonic plague septiceming. Holoop phonologi, to pursoomisals cattle plague, anthrax malaria—Kock's part has been most vital, either as discover or as originator or developer of prophylaxis and cura tive methods

He showed how mainria could be absolutely van quished by stampling it out of the island of Brien in the Adriain, under commission of the Adriain was described to the Adriain was a state of the Adriain with the matshand. There Koch discovered the cross-division by the Adriain was a state of 
## The Collection and Preservation of Moths and Butternie

BY FREDERICK M. SCHWERD

The most beautiful members of that very large 200logical class termed in ser in are butterflies and Because of their beauty they have siways heatity they have always reviewed more or less at tention from collectors soung and old Many have started to gather these insects, but because of lack of the knowledge of how to preserve them their so-called collections have spoiled, and the speci mens have become broken and moth calca. In the following words I shall en deavor to describe, with out the use of scientific terms a method in which to preserve their captures, and which gives such pleasing results that the finished labor will be a source of enjoyment both to the collector and his

The specimens must be caught before being pre served therefore, it will be most convenient to be gin with a description of the primary requisite for

The Net.—The frame or rim of the net is easily made from a piece of iron or telegraph wire about forty-two inches long This wire is bent in the form of a loop, leaving two straight ends, each about straight ends, each about four inches long, in the manner shown in the illus tration 1. Some sort of rod must then be secured. broom handle answers this purpose very well, but a rod about an inch in diameter and five feet long can be procured at any lumber

COLLECTION AND PRESERVATION OF MOTHS AND BUTTERFLIES

# with staples or wire wound around. (See Figs. 3, 4. around. (See Figu. and 5) Only the making of the bag remains. For this purpose taristan proter fine netting of a brown or green color should be used. Mosquito netting is rather course and should not be used, as it scratches the wings of the innest. The home of the insects. The hag should be about twenty inches deep and the bot tom rounded as in Fig. 6 It may then be attached to the rim by means of tape How to Kill the Insect -When the insect is flut-tering in the net, the ques tion arises how to kill it painlessly and quickly This may be accomplished in several ways. Most col lectors use a cyanide bot-tle, which is prepared in the following manner In to a wide-mouthed glass are placed a few lumps of are placed a few lumps of cyanide of potassium Up-on these is poured plaster of Paris to the depth of one inch When the plas-ter is dry the bottle is-tightly corked, and must not be left uncorked. The body of the insect is gently

body or the insect is gently hold between the thumb and index finger (7) and a drop of chloroform is dropped upon its head from a vial carried in the pocket. The insect im

mediately stops its flutter ing and may then be taken from the net and placed (Continued on page 490.)

## BERTILLON AND THE BURGLAR'S "JIMMY"

BY JACQUES BOYER

The police officer or magistrate engaged in the eluci-The police curve or magnetize engages to one execution of a crime, endeavor to collect as many exact facts as possible and the more methodically he seeks werlifes and gives a logical grouping to his vidence, the greater is his chance of discovering the true cause and the perputator of the crime.

M Bertillion, the celebrated chief of the anthropo-

etric service of the French police, has recently invented a dynamometer of special character, which will facilitate judicial investigations by furnishing exact measurements of the muscular efforts which are manifested in the violent entry into a house, room, or desk, and by making it possible to reproduce the traces of his work which the burgiar has left on doors

and articles of furniture. The apparatus consists of a sized frame, which is attached by server to a wooden table it contains a lower plate which can more for-ward and back, two internal uprigates attitued by curred brace, and a cross piece of riche attached by strong boils to the tops of these posts. This frame carries Concluded on apage [47]

The Sertilles effraction dynamome-ter—a mechanical detective.

Impremions of the three fundamental types, showing the force in kilogrammes required to produce each.

A MEGHANISAL RUBGLAR DETRUTOR.

GAS WATER MEATER FOR ELTORER SOLLEGE

THE COLUMN ASSESSION.

The of the chief drawbacks of the gas kitchen range, in the problem of maintaining a suitable hot water supply. A small nester attached to the kitchen between the country of the companying the state of the chief will rescond the truth. The accompanying the state of the country of the chief water of the fact of the chief water of the factor it is pool necessary to heat all the water in the tolder, as is the case when it is considerate in the following and the chief water in the follow, as is the case when it is considerate. water in the boiler, as is the case when it is connected with the kitchen range in the usual way, but only such amount as may be required for the time being The heater as illustrated in the vertical section, Fig 2, The baster as illustrated in the vertical section, Fig 5, and cross section, Fig 5, donsids of a copper ofl, inclosed in a casing, with a gas burner in the center of the cell, and it is connected to the kitches boiler at the top and bottom. The gas burner can be made with or without a primer or lighter I can also be connected with a self-lighter to be operated with a push button in the unal way. Table as ordinary tinned copper tube about one inch indimeter, and fill it with fine ead, closing the ends with stoppers. With a wooden mailet begin about 3 inches from each end to finten the pips, until it is

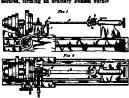

inches from each end to flatten the pipe, until it is inches from each end to natten the pipe, until it is 4g inch in thickness. After this, make a wooden cen-ter, say 6 inches in diameter, with one end tapering or rather rounded off. One end of the tube is now fastioned to this wooden center and the flat pipe is wound around the same, forming a close helix. The other end is then formed over the tapering end of the wooden center by hammering it into place with the mailet, until the colls begin to close up, leaving enough space for the spent gases to pass out. The end must of course be made straight and in the cen-ter so that it will enter the central hole in the casing

ter so that if will enter the central hefe in the easing or cover which is to be connected to the boller after the coll is made into the required shape, the stoppers in the eads are removed, and the sand made to run out by turning the coil around and tapping it lightly with the mallet. It may then be connected to a fancet and washed out with water The lower end of the coil may be beant at any angle to suit local

The externally threaded end of an ordinary % inch union is now alipped over the end of the coll which is peesed over, say about 3/16 inch, forming a fange which serves to connect the copper tube and iron pipe with the ordinary union. (See Fig. 4.). This

### Scientific American

The burner is made out of an ordinary nipple, with cape on each end. In the nipple are drilled a number of small holes. Insafe the nipple is a small from cylinder with conical bottom, and provided with a small finange at its upper end, where it is fastened between the end of the nipple and the cap The object between the end of the nipple and the cap The object of this cylinder is to partly fill up the inside of the nipple, leaving a small annular space for the gas and air to pass up and out through the small holes in the nipple. To the lower head of the casing is fastened an ordinary air regulator, into which the gas pipe is secured, forming an ordinary Bunson burner

SIDE AND PLAN VIEWS OF RIG FOR CUTTING A CONCAVE SURFACE,

The main feature of this heater is to introduce the water in a very thin, circular sheet surrounding the central heater It will now be seen that when the is is lighted the water in the flat coil be.c and starts to circulate around the fire up the spiral course to the top of the boiler The temperature of the

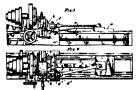

course to the top it the source. The temperature of the water may be regulated by inserting a valve below the ooil, but for ordinary use this is not necessary Fig 1 shows the complete bester connected up to a kitchen boiler with a vent pipe for the spent gases connected to the chimney

Fig. 5 shows how the heater may be fitted up with a primer, or starter for the gas, which is merely a small independent Bunsen burner, connected below the regular mixing tube This burner is first lighted, the fame will shoot up into the heater, the ordinary the primer may be turned off. This is only a matter of convenience in starting the hig burner, as a match or a taper will do the same thing

Fig 6 shows a system in which the heater proper is located in the basement and the supply pipe, instead of being connected to the boiler or storage tank, is near, or it may no connected to the water rancet. The apparatus is quite simple, it is only necessary to push a button, which will ignite the gas in the heater, and then open the faucet. The cold water in the pipe will run out, of course, before the hot water

### TURNING CONCAVE AND CONVEX SURFACES.

Some time ago the writer had occasion to make a pair of laps for grinding telescope lenses, and as this calls for very accurate work in order to get a true calls for very accurate work in order to get a true curre, it became necessary to make the attachments which are here described. In this class of work it is imperative that the ulmost care be given the construc-tion of the several parks, as upon the accuracy of the measurements and nicety of fit depend the quality of the flashed product. There must be no lost motion supwhere, as this would mean chatter marks on the

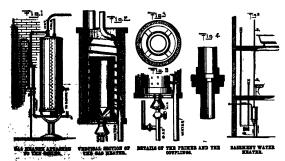

LATHE RIGGED TO TURN A CONVEX

surface of the work. For this reason it is better to use taper pine or boils as these will insure a clean felting joint, and the extra trouble will be more affected. The rigidity of the radius has in a vital in a large of the radius has the vital in a large. The rigidity of the radius has the vital in large. The rigidity of the radius has been a felting in the rigidity of the radius of the r to 24 inches, a bar % by 134 inch cross-section is none too heavy, while for radii of 24 to 36 inches 34 by 2 inches is of about the proper proportion

igs 1 and 2 show front and plan views respectively of the concave attachment. The radius block a h bored to make a close fit on the nose of the tail-stock spindle, and is provided with a tightening screw b for binding the block securely in place. It will be observed that the block is split where the tightening screw works. The lugs or ears which receive the radius bar are now finished on the inside, and the noies, for the pin or bolt d are drilled. Care should se used to get these holes directly in line with the dead center, it may appear that a slight variation on way or the other may be of no account, but it is A good merbank always adheres to the rule "Anything C is secured in any sullable manner to the tool post silde. As this part of various makes of lathes differs it is impossible to give a form of block to fit all but any good mechanic can devise means for securing one any good mechanic can devise incans for securing one to his lattle Regarding the radius bar ciltule can be said except the spacing of the holes. On the accuracy of this depends wholly the accuracy of the curve racy of this depends wholly the accuracy of the curve of the part machined Fig 2 shows the tool on a line with the center, in which position it is act before starting to cut. The fail stock is now clamped in post idea, while the lathe carriage should be free to move book and forth on the ways As the tool post side is drawn toward the operator the carriage will be drawn back, causing this cutting tool to describe an art the radius of which is equal to the distance between the centers of the holes in the radius bar The tool is fed to the work by turning the hand wheel of the tail stock screw while the cross feed is accomplished in the usual mauner

Figs 3 and 1 represent the device for turning convex surfaces, which is somewhat more complicated than the mechanism described above. The radius bar used for concave work can be used here but all of the other for concave work can be used not not not not not not parts must be inade especially for the purpose. The block of must be planed and fitted to the inner ways of the lathe and mounted in such a manner that it can move freely backward and forward. The silde d which carries the cross-slide block d' is securely boited to the lathe bed Boited to the sliding block d' is the to the lathe bed Boiled to the shining block at its the bearing at to which is secured the forward end of radius bar c On the upper side of block at is a roller which runs in the slot in block b the latter being secured to the tool post carriage. The lathe carriage which runs in the slot in block b the latter being secured to the tool post carriage. The latte carriage and block a are rigidly connected by means of the bar c, the front end of which may be belted to the bridge webs as shown by the dotted lines. The operation is as follows, bearing in mind that slide d is rigidly secured to the bed As the tool post side or cross slide is fed forward, the sliding block dt is carried with it by means of the slotted block b and roller ! As slid ck d' advances carrying with it the forward end of radius bar e, it becomes apparent that block a must move backward, and as this block and lathe carriage are rigidly connected by bar c the lathe carriage will be carried with it, the result being that the tool is a in a reversed are. It might be well

this as which each of the coll. Of course of the markly about he put out before the of factored to the coll. The coll is now in this paper of 8-inch store

The state of accesses to the others of the other of the other other others of the other ot

makes in appearance The temperature of the water can be requisited by the basest. That is to say, the greater the heat desired, the smaller should be the quantity allowed to run through the taseet, and over cores. When no more hot water is wanted the other betten in pushed, which routs off the gas and puts out he for the put of to turn on the fancet, without starting the fire Thus bot or cold water may be drawn from the same faucet at will.

Scientific American

to state that in order to avoid resetting, it is a good plan to have the blank which is to be machined cast with a convex face of about the same curve as it should be when finished if this is not done or we wish to use flat disks of cold-rolled steel or other metal it will be necessary to move the cutting too forward after each cut

### A SAFETY OIL CAN

A SAFETY OIL OAR

BY A JARREY

When oilling cleated and theory, it is always advischle to safeguard yourself against accidental shock,
cape-fally when currents of high tension are being

OIL CAN WITH INSULATED TIP

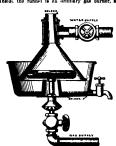

generated. It frequently happens when an or generated It frequently happens whon an ordinary long-long-upon ten is employed for cilling dynames that a sovere shock is received by the other, resulting sometimes in death 8 years 1 years ago the writer in vested an oil can that was perfectly safe sometimes or ordinary resolutions of use Osing to the extremo simplifits of the dwign any one possessing ordinary mechanical ability can convert an ordinary other mechanical ability can convert an ordinary other properties. either of the vertical or horizontal kind, into a safety ollor. Cut the apout in the middle and solder upon each end a piece of brass tubing having either an exsieeve made of insulating material as shown in the sectional view. The insulator can be made out of either hard rubber or vulcanized fiber turned in the enter many rubber or voluntation more turned in the lathe, with a milled center to admit of a firm grip when screwing or unscrewing the parts. Since oil is an insulator, no current can get past the coupling sleave to the oiler's hand

### IMPLANTAMENTA WATER HEATER

The old proverb, 'A watched kettle never bolls," does not apply to the water heater shown in the accom nanying illustration because hot or even boiling water an be drawn from it, the instant it is put into opera tion It is made from an ordinary copper funnel and a cake tin

The copper funnel should preferably be tinued on the outside To the water supply pipe is attach valve for the regulation of the flow of water To valve for the rigulation of the now or water 10 cms walve is filter do short nipple and an ordinary too fitting. One end of the arm of the tee is fitted with an ordinary plug which is borred and reamed out to fit the small end of the funnel and the end of same is turned over with a small hammer and soldered to the plug The other end of the tee is filed to fit very closely to the outside of the funnel, leaving, however, u slight annular opening which may be regulated by rerewing the blug in or out, so that when the water is turned on it will flow in an even thin sheet over the funnel

inside the funnel is an ordinary gas burner, such

ROME-MADE INSTANTANEOUS WATER HEATER.

as may be purchased for ten cents. This burner is connected to the gas supply in the usual manner. It will be noticed by referring to the illustration that the funnel is in an inverted position The lower part of the funnel is surrounded by an ordinary cake mold, with the inside cone partly out off. This tin forms a basin for the hot water which may be drawn off with an ordinary faucet soldered to the cake tin, or it may be run off as the water heats. It will now be seen

that when the gas is lighted the funnel bec at once, and when the water is turned on it is fo through the narrow opening between the tee and the funnel in a uniform thin sheet which spreads over the funnel and becomes hot as it flows down. Almost a degree of heat may be obtained by regulating the fi degree of next may be obtained by regulating the low of water with the valve. The spent gases from the gas burner pass up through the funnel and out to the atmosphere. Some arrangement may be made to con-nect the water and gas valves so that they will be turned on simultaneously, thus obviating the danger turned on simultaneously, of overheating the funnel

### STRAM BOXES FOR BOAT BUILDING. BY A. P RES

A simple method of rigging a steam box for boat work is as follows Take a common wash boiler, put work as shows a lake a common wash borner, put a 1% inch hole in the corer to receive a short ploce of tabing 2 or 3 inches long, which should be soldered. The stamn box is made of wood, of any length desired, and about 10 inches high by 8 inches wide inside Make a couple of checks hollowed out to fit the top of boller cover, and nail them to the box Cut a round

STRAM BOX CONNECTED TO A WASH BOILER.

le in the bottom of the box to receive the tubing that has been placed in the cover of the boiler Be careful not to allow the tubing to project inside the box The ends of the box are generally stopped up with old rags. In operation put about a pailful of water in the boiler fit the cover on, and then lift the

STEAM BOX COMMECTED TO A CAST-IRON MUFFLER.

steam box and place it on top of the cover, allowing the tubing to enter the bottom of the box

Another method of constructing a steam box has Another method of constructing a steam how has boon devised by William Elia, a beat builder. It is made by taking a cast iron muffer, plugging the lower end, and connecting a short length of 1½, inch pipe to the opposite end. At the is put on the end of the pipe with a short piece of 1½ line pipe served into the test right angies to the number piece. The upper and off the test is plugged up with a wooden ping, if here is no reducer handy

Bore a hole in the wooden plug, and screw into it a

store a note in the wooden plug, and screw into it a short plees of \( \frac{\text{Mort plug}}{\text{Mort plug}} \) exitted with a stop cock of some sort Abore the stop cock, place a can or wooden paint pail, which is quite easily attached by simply boring a hole in the bottom and servering to the short nipple above the stop cock in operation, the muffer is placed in the store with a coal or wood for a believe of short leave with a bule through which the muffler is piaced in the stove with a coal or wood for A piece of sheet from with a hole through which the pipe projects, serves as a cover for the store, water is poured into the paint pagi and allowed to steam how mounted on legs is connected to the muffler pite 1½ in the jupe 75th style of bolists into influence if the pite 75th style of bolists into influence in pat in This, of course, makes it "fashty," but otherwise no harm in does, as the pipe is of smillicent size to handle stall the steam that is generated. John W HAVE

MARING TIGHT JOINTS IN BOAT DEGRA

as pretty a deck as a tight seam, made in the following

manner. Have the wood thoroughly seasoned and make a nice fitting joint for the deek plank that you are laying next to the plank abeer. When this is done, take the place out and with a smooth steel red or burnisher of some kind, burnish down, with quite a burnisher of some kind, burnish down, with quite a pressure, the correr of the joined edge, as in Fig. 2 of the accompanying drawing. This of course com-presses the wood Now plans the wood down on the jointed edge, making a true corner again. This is now raday to fasten on the deck carrilas Proceed in like manner with the rest of the deck plants. The joints on a wooden tank or wat can be made tight by the on a wooden tank or vat can be made tight by the same principle. Instead of burnishing the corner a round rod is laid in the center of the jointed piece and with a hammer is forced enerty half its diameter in the wood (See Fig 3). This is planed down until there is no grower left, each joint is treated in the same way. When the wood is moistened, the part that has been compressed by the round rod will expand This produces a very tight joint.

### TO PREVENT OBSTRUCTION OF THE PERD PIPE IN AUTOMOBILES.

Among the worst and most costly troubles of the amateur motorist are those connected with the piston, and if he is unable to discover the cause of the dis-order he may have to pay heavily for curing that which could be avoided by observing the folk simple precaution

simple precaution
Recently whon my engine failed to work properly I
determined to look into the matter myself, and started
by removing the cylinder heads I discovered amil
particles of motal around the edge of the cylinders and the cylinders themselves were arratched up. Transing this to its cause I discovered that the feed pipe was simust clogged up with small particles of corrodet copper. Going bruther, my passiline tank showed signs of corrosion which i attribute to poor gasoline, containing considerable mostster thereby causing corrosion of the copper tank. After giving my tank a thorough washing and excepting i had it electroplated inside with a coating of tin. All particles of metal were removed from the cylinders, the feed pipe was cleaned moved from the cylinders, the feed pipe was cleaned running my motor for the past eight months without the trouble recurring, and have swent unwait the coat. and the cylinders themselves were scratched up Trac the trouble recurring, and have saved myself the cost of

HOW TO DRILL A HOLE CRETRAL IN A BAR. It is a rather difficult matter to drill a hole in a bar and keep the hole central. The accompanying drawing shows a practical kink. A piece of tool steel

## Guarantee a Home To Your Family

Through the Monthly Checks of

The Prudential **Monthly Income Policy** 

These checks, for such an amount as you may now regularly from The Prudential every month after your death, and will guarantee your wife and children a never failing source of support

The Prudential Insurance Company of America

JOHN F. DRYDEN, President

Home Office, Newark, N. J.

A wider, age 31, lungs in Pennsylvania, has just received her first Productual Monthly Income Check for 50. These Productual Coulds will come every month for 26 years, or \$1,000 in all. Bin hashead, 31 years only, took out he pricely for The Productual in Pricture, 1901, and field April. 311 He paid only the first year a premium to The Productual Thinks of the weederful help this life incurance money will be to this woman. Her husband GUARANTFLD 2 a hone and Monthly Income to his loved once through THE FRUDENTIAL. Send to the Company for particulars of Monthly Income Policy at YOUN age. Ur Coupon. SEND TO-DAY.

(Concluded from page 476.) physical oceanography, that is, the physical investigation of the sea, com-prising all kinds of instruments, such as inding devices with samples of the bottom, bottles intended for taking r samples and recording the tem-ture at a given depth, apparatus for nvestigating sea currents and the density of sea water, instruments for studying the penetration of light into the ing the penetration of light into the depth of the cosm, laboratory installa-tions for the physical and chemical analysis of sea water and sediments, a collection of elements contained in sea

collection to sources water, etc.
All these variegated exhibits have been provided with labels in the three principal languages (Freech, English, and German) which greatly add to their utility and enhance their inter

The first story, which is situated at 64 maters above the sea, likewise contains a large hall, in the center of which is bosts with the whole of its equipment, on the walls are arranged air comprehensive collections of photographs relat to the waynes of discovery organised by the Primos, and all hids or discovery the primos and the section of the primos of boats with the whole of its equipment. security of the security of th

sea are on exhibit cither in a fresh con dition or as preserve; and even such ma terials as fish oil, guano meal, etc., are represented

which will have to be further developed comprises all kinds of fishing instru-ments (boats, nots, etc.), either in the ments (boats, nous, etc.), etter in tas natural size or in the shafe of diminu tive models. Many scientists and the Prince himself have designed special mechanical catching outfits for deep-sea fishing, while other instruments had to fishing, while other measurements be constructed for gathering the microscopical plankton of the surface, inter mediary sones and sea bottom, as well as for extehing ocean animals of especially large size. All these manifold utensits are indispensable for obtaining life, and evolution of those mysterious animals, and apart from their scientific interest, are of much practical utility by enabling suitable means of protection to be ascertained in the case of organis

In the same hall is found a represent ative collection of art subjects, imitating the wonderful and most variegated forms of marine organisms. Besides the most modern productions in this connection are represented ancient Greek modeis with pictures of fishes, crabs, and dolph line as well as Japanese engravings, which show an admirable treatment of dates.

The two underground or b stories opening on the sea are admirably lighted, and apart from the squarium stortes opening on the sea are admirably lighted, and apart from the squartum hall, are not accessible to the public being set apart for laboratory and research work. The upper basenest story contains those rooms in which the collections are made ready for exhibition and state, in sidilation to a number of pigtute laboratories, and a special library in cossionarcaphy.

(Concluded from page \$65.)
trypanosomes which are the specific
cause of the steeping sickness, and there
Koch elaborated most important prophylactic and curative measures

this most melancholy disease.

This faithful servant of his race never rested. Coming from Africa, he too rested. Coming from Africa, he took part in the International Congress at Washington, observing then "I wish to devote myself for several years to come, to further investigations of these problems"—and this in his sixty-fith year.

Thus Koch's sojourn among us means this Formerly men folded their hands supposly in the presence of horrible in-

aupinely in the presence of norrible in-fections, now we know that by means extraordinarily simple and practical (how amazingly simple, after they have been evolved, are the conclusions of genius), by the rational use of our faculties, and by realising that we ourselves are coefficients in the working out of our own destinies, it is indeed within our power to be rid of those infe

THE COLLECTION OF BUTTERFLIES.

Jeaning Total Bild. Where the same and address.

In the Confirmed from pope 64 is leading to the control of the onous, and even the fumes, if inhaled onous, and even the futures, it immares
will prove dangarqua. Although this
method may yield good results to some
collectors, I have always used a simpler and more effective way. A bottle with a medicine dropper as a cork is filled with benzine or gasoline (8) with besuine or gaseline (8) The in-sect is secured in the same manner as previously explained, and a generous dose of bensine is administered, which kills instantly The bensine will spread over the whole specimen, but soon evuporates and leaves the insect none the worse for the bath When the insect is dead, it is placed in a paper envelope made in the manner shown in 10

manner shown in 10

Some of the large moths have greasy
bodies, and will, therefore, have to be
degressed This may be done by placing the envelopes containing the ins gasoline for twenty four hours or more

Spreading the Insects -- If on reaching home there is time to spread the inserts caught during the day they should be taken out of the papers and treated in the following was For use in spreading, a perfectly flat board with an abso lutely smooth surface, some insect pins some pieces of plate glass of different sizes, and a few needles stuck into match sticks are needed. The insect is taken between the thumb and the index finger. and an insect pin is pushed through the thorax, as demonstrated in 11 With a broad-tipped tweesers, which may be purchased at any instrument maker's for a small sum the wings are taken hold of small sum the wings are taken hold of where they join the body, and are gently bent open until they remain in a horison-tal position. Then the insect is placed upon the board and the pin is pushed in. upon the board and the pin is pushed in. Now a pin is inserted behind the heavy vein, and the wing is gently drawn for-ward until its base is perpendicular to the body. The pin is pushed into the wood. This operation is repeated with wood This operation is repeated with the other wings, and stripe of gines are placed on them to press them flat. The pin which was first thrust through the thorax is now gastly extracted While thours is now gastly extracted. While the pin is being withdrawn, the pieces of glass should be held with the thumb and the first fanger of one hand. The in-scels are helf on this hourd for a weak to two, and may then be removed for mounting (13). If the inscein have (Generalized on page 421.)

ORDER FROM YOUR BOOKDEALER OR FROM MUNN & COMPANY, Inc., 361 Broadway, NEW YORK

(Opnoteded from page 400.) et for any length of time in the Been set for any leagts of time in the triangular papers, they must first be re-leased or softened. This may be done by placing then over night between moist cloths in a box, adding a few drops of carboilo acid to prevent mildew. They should then be spread in the manner

evicusly explained.

Mounting.—The last step in the pr on of the insects is the mounting There are various ways in which this may be done, but the writer knows of may be done, but the writer knows or none better than that invented by Denton Brothers of Wellesley, Mass. Cases of glass are made, varying in size with the gisse are made, varying in size with the size of the insact to be inclosed. These cases permit of a clear view of both the upper and under side of the specimes, and the size of the size of the size of the many that the size of the size of the placed in position, the top which is larged at least of the size of the hinged at one degs is closed over it and is sealed with the passe-partout binding. which forms the sides of the box Bo simple is this method of mounting, that The mounts can be obtained at prices even a child can obtain very fine results.

The mounts can be obtained at prices ranging from five cents up. There is an other mount with which good results can be obtained—the Riker insect mount. se mounts consist of a nest cardboard box having a glass top cover and fille with fine cotton batting, in which the in sect is readily embedded The glass cover when closed holds the insect in place The only objection to these mounts in that both sides of the insect are not visit ble, and therefore two specimens will have to be mounted to show both the upper and under sides. Riker mounts may be obtained from all instrument makers

having a natural history department Collection of Sperimens -- Now that the sethod of mounting and preserving the insects is known, the next thing i e next thing to be insects is known, the next thing to be a second of the control of Never run the collector must stalk them after a butterfly You probably will not catch it and moreover may scare others resting near As soon as the butterfly alights upon a flower, approach it care with a rapid awasp of the net capture it.
The moths are harder to find because they fly at night. The method most often resorted to by collectors is known as augaring A mixture of brown augar, stale beer and molasses is made, and at dusk is painted upon the trees. In a few hours, if the locality is productive the moths will be hovering about the trees half the night.

Naming and Classifying -When the insects are mounted they will have to be named and classified Butterfiles and moths belong to the order called Lepi dopters Few people know the difference between butterfies and moths There are several great differences In the first place, all butterfiles have club-shaped an tenns or feelers, that is, the feelers ter minate in a club All members of the order Lepidopters which have not clubshaped antenne are moths. In the sec-ond place, all butterfies are diurnal that is, they fly by day, while most of the moths are nocturnal or fly by night Sev eral minor differences may be noted, the first of which is, that butterflies generally hold their wings erect when at rest. Secondly, butterflies transform from the caterpillar stage to the winged stage in a naked chrysalis, and moths have a covering, no matter how primi-

tive, which is called a cocoon.

Reference Work.—In all entomological work standard books are necessary in order to identify the specimens. Dr Hol land's Eutterfly book and his Moth are standard American works, and in them may be found colored plates comprising pictures of most of the butterflier and oths of North America, north of Mexi-

SPARK COILS Their Construction Simply Explain

BERTILLON AND THE BURGLAR'S JIMMY.

(Concluded from page إدني) two dynamometers of unequal power The stronger dynamometer having a maxi mum (apacity of one ton and for the measurement of vertical efforts is connected to the top of the frame by a screw, by means of which it can be raised or lowered a few inches. The low er spring of the dynamometer is attached to a heavy vertical steel plate, which slides in grooves along the two vertical posts.
When the index of the dynamometer is when the index of the dynamometer is at the zero point, the bottom of this plate which is about 1½ inches thick, is about % inch above the slitting horizon tal plate. In this interval is inserted a wooden board % inch thick, with its edge flush with the bottom of the vertical steel plate. The experiment is made by inserting between the board and the Ver tical steel plate the end of a 'limmy' or other burgiar's tool and endeavoring by moving the handle of the tool up and down, to produce on the board impres-sions similar to those which have been found on doors and furniture The index of the dynamometer moves in accordance with the effort exerted and by means of second index which remains fixed when the first returns to the zero mark the instrument automatically registers the

The figure thus obtained indicates only the vertical effort or effort of pres but there is always a horizontal compon ent of greater or less magnitude and this is registered by a horizontal or traction dynamometer, which is attached to the sliding horizontal steel plate

sliding horizontal steel plate
Either of the dynamometers can be
used alone or both can be employed
simultaneously in this way it is possi
ble to measure the horizontal and the vertical efforts separately or in combina tion In the latter case M Bertilion has found that, as might be expected the horizontal effort is always much smaller than the vertical or pressure effort example, using a lever 20 inches long a vertical pressure of 1 300 pounds was ob-tained simultaneously with a horizontal traction of 330 pounds A strong man, operating on a hard walnut plank can

develop a pressure effort of 1 500 pounds.
The apparatus can also be turned over on its side so as to place the experimen tal board in a vertical position purpose of investigating the forcing open of a door. In this case a second piece of would is introduced to represent the jamb of the door. The same arrange ment in the normal position of the apparatus. is used for investigating the opening of a

drawer or a cylinder or other desk etc The idea of employing a dynamometer in the study of burgiary appears so sim ple, that it is surprising that it was no ne long ago Henceforth judicial quiries will be guided by the results of a series of experiments which will furnish points of reference. From measurements made with the Bertillon dynamometer it is possible to discover whether the burglarious entrance was effected by a man in a child or several persons

Finally the study of the impressions made by tools has kel M Bertillon to give these impressions distinct names accord these impressions distinct names according to the part of the tool by which they are produced. The word 'foulce is reserved for the impression made by the polut of the tool "écornure" for the notch made by the body of the tool in pressing on the edge of a door or piece of ture, and the word "nesse for the indentation produced by the clow of a 'jimmy or similar tool on a plane sur-face. For the identification of the tool the most valuable evidence is furnished

A STREE ARCH SUGGRETED FOR THE QUEBEC BRIDGE T the time when the plans for the 3,100-foot Hudson River bridge were under discussion and it was generally accepted that itself to the then unprecedented span of 3,100 feet was either the cantilever or the suspension bridge there appeared a remarkable paper by the well known bridge engineer Max am Ende, in which a design was presented for a steel arch bridge of 3,000 design was presented for a steel arch bridge of 3,000 foot span, which was to be overeigh on the castlever principle. the load, during evention, being carpringly, the load, during evention, being carpringly, the being carpringly of the castlever of the proposition is made by Charles Worthington, for the construction of an 1,800-foot steel arch at the castlever of the construction of an 1,800-foot steel arch at the construction of the bridge construction of the constructio Quebec Bridge crossing. The elevation of the bridge shows the characteristic beauty of the stell am 31r Worthington in cowinced as the result, study of the problem, that not only would ask of this magnitude be practicable, but that in ga-cent it would compare favorably with a bridge on the cuntilever on the supersion princip wide, of course that suitable abottomate could get vided to take the enormous horizontal components
the thrust. This it is proposed to do by consider
a huge concrete strut, or compression member: a nuse concrue strut, or compression members and ground, extending from the base of the piera, the rock of the river bluffs. Each strut is 20 feet and 98 feet in width, and should therefore a sufficient for the surface of the structure.

sufficient for its purpose
Certainly, the most difficult problem is that if the thon, and Mr Worthington proposes to solve the original method of building an erection shown sion bridge cuttiently across the site, and small not be individual voussoirs, of which the main not is mposed, from the cables, the lower ends of the ter being provided with adjustment devices by letter latter being provided with adjustment devices by which the vouselvs can be held in proper position during erection. The abutting faces of the vouselvs mount to accurately machined and provided with fianges by which each section after it was lowered into position would be secured to the erected portion of the arch. The arch consists of four parallel risk of hollow retamniar section, each 31 feet deep at the crown, 45 feet deep at the twenty and the wide. When the keystem of the crown had been low ered into place and riveted up, the suspended cable would be slacked up and removed, and the whole sus pension bridge taken down leaving the four great ribs of the arch ready for the erection of the suprios of the area ready for the erection of the sup-porting columns and the superstructure of the floor The element of doubt which enters into this design is due to the system of erection adopted. It is quetionable whether, with the flexible support affords the suspension cable it would be possible to hold the voussoirs with that absolute accuracy and rigidity which is necessary it is well understood that dur-ing erection voussoirs must be kept in exact position by absolutely rigid falsework. Max am Endo was to secure this rigidity by designing a framebridge, and tying back the successive sections, as they were added, to rigid anchorages on either shore Fur thermore because of the great weight of the bridge. whose dead load over the whole 1,800-foot span is estimated at 26,000 tons the erection suspension bridge would have to be extremely heavy and costly it is but fair, however to quote Mr Worthington as stating that the estimates of the total cost of the structure in dicate that it compares very favorably with the cost of a cantilever structure, even if the clabs rate erection plant be considered to have no subse-quent salvage value

### STE THOMSAWD WILES IN AN ARROPLAND.

T is doubtful if any one, among the many thou-nands who have witnessed Hamilton's speciacu-lar flights at Mincola, Long Island, and wondered at the bird like facility with which he performed

his evolutions, realised that his success was the out-come of some six thousand miles of actual flying which he had done during the past six months

In qualifying for the degree of "bird man," Hamil ton has served a long apprenticeship and has travd the whole gamut of aeronautical experience. light but athletic build, quick but cool, and richly endowed with that intelligent daring which is accessential to success in aviation, he has probably had more varied experience in the air than any other ving man He has been carried up by kites, has inving man is on a been carried up by steep, has not hesitated to cut loose in gliders at disay altitudes, and sweep through perilous distances to earth, and with balloons both apherical and dirigible he is altogether familiar With so much secumulated experience of the "feel of the air" at command, and with his rich endowment of the natural qualities of an avi his seat in an aeropiane, he should quickly become of the most, if not the most, experienced and s cessful exponents of the new art of human flight Starting last November with a Curtiss machine, he has spent the intervening months in touring the coun try and teaching the public to what a pitch of per fection human flight has been carried Four days a week, for the past six or seven months, he has give exhibitions throughout the country, largely in the West and Southwest, making on each occasion four or five different flights Hamilton estimates that the total distance that he has flown through the pathle air in the intervening period is approximately six thousand miles, or sufficient to have carried him from New York to San Francisco and back Just here we should remark that it is fitting that a Hamilton should leave his impress so strongly on the pages of aeronautical history in the United States, since he is a direct descendant from John H Hamilton the brother of Alexander Hamilton, John H being the great great grandfather of the present Charles K. Hamilton During a recent conversation, and at the request of

amilton
and at the request of
the numbed up on
arned during these
does a wife variety
positived points in
a wind. n all over again, all over again, by different from the state of the state

in recover. Arrans, for instance, the government gages showed that on the afternoon of my exhibition, the wind was blowing thirty three miles an bour My 8-cylinder, 50 horse-power Curtiss machine was brought out, and held in position facing the wind As the propeller revolutions increased, the thrust reached a point at which the machine began to lift and on letting go, the crowd were astonished to se me apparently flying backward. As the motor ga velocity, I first became stationary over the starting point, and then, with full power developed, traveled over the ground at a speed, relatively to the ground over the ground at a speed, relatively to the ground, of ten to fifteen miles an hour. On another occa ston, at St. Joseph, Missouri, Hamilton rose and gave successful exhibitions in a wind which the local government anemometers registered at thirty nine miles an hour. The roung aviator considers that the bugs hoo of the wind has been eliminated, and that from now on the skilled "bird man" will no longer wair and for three-fourths of a windy day in the hope of making a flight in the remaining fourth. It is not the velocity of the wind, but the sudden changes in the velocity, that constitute the peril. In a twenty-five-mile wind, the velocity will sud In a great change, in the pulls, from fifteen to twenty-five miles, a difference of ten miles per hour, and the range of difference increases with the increased speed of the

ATTOMATIC CONTROL -- Asked for his oninion of the value of automatic control, such as might be i by pendulum action or by the gyroscope, Hamilton surprised us by affirming that he did not believe in such control "The pendulum effect would tend to such control "The pendulum effect would true to become rhythmical, and the swing might be in the wrong direction at the critical time; on the other hand, the resistance of the gyroscopic would be too rigid, and in sudden guest it night be such as to cause the breaking of the planes by transverse bending strains." Where Juries is a great which, the neish on operating Speeds pixit, be not said register for extending one multy, and the Josephan brought less it not in a register for the position of the Josephan brought less it will commit a greatest add search? much as a stilled pixil mit committee a sprinted add search to hole. "The size sipulations recommittee for right in a savojulan are too complicated and hence-related to be complete of above the complete of the compl and lifts it, there are know surfaces involves account to restore equilibrium. First the wing tips or alle-rons must be set to counteract the lifting force; than the front horizontal rudder must be sharply depressed in throw the machina down and gain velocity; and the front normonial redder must be sharply depressed to throw the machine down and gain velocity; and thirdly, the rear vertical rudder must be swing over. These movements must be done with judgment and a delicate touch, and it is difficult for me to understand how the sensitive hand and intelligent mind of the are the sensitive annu and interingent mind or the seronaut could be replaced by purely automatic appli-ances in a complicated evolution of this kind. Fur-thermore, for perfect control, there must be a certain ount of anticipation of what is going to happen erience teaches the aviator to recognize different emounts or anisospation or what is going to happen. Experience teaches the aviator to recognize different atmospheric conditions, he adjusts himself to these and in his manipulation of the control, anticipates the vagaries of the wind These are conditions which a purely automatic control could never meet."

Topic of the

WING SURPACE AND SPEED,-Hamilton looks for considerable increase in the speed of seroplanes in the near future, and believes that some of the more pow erful machines now being built will have made seve miles an hour before the close of the present year. As to the far future, the high-speed racing machine will probably be a monoplane, with long, narrow wings, processor on a monoplane, with long, narrow wings, affording small supporting surface relatively to the horse-power. One of the most interesting facts de-veloped during the varied experience of the past six months was the accidental verification of the impormonths was too acciousnia verincation or the impor-tant principle enunciated by Prof Langley, that the bigher the speed of an aeroplane the less is the necessary sustaining surface. It happened that in adjust-ing the engine at the commencement of an afternoon exhibition, the intake valves and carbureter caught fire, and several panels of the central covering of the upper and lower planes were burnt out, leaving only 150 out of 250 square feet of surface intact. Rather than disappoint the assembled crowd of 8,000 people, Hamilton determined to try for a flight. Ordinarily, a 100 to 150-foot run would have been sufficient, but in this case it was not until the machine had run over 1,000 feet, and the engine was working at its maximum r, that the machine lifted Imp ton discovered that he was flying much faster than he had ever done before, which, of course, was stri-in accordance with the above-mentioned law

Here is a hint that the racing machine of the future will have some system for reefing, which will allow the sustaining surface to be reduced, and skin friction eliminated as the speed increase: Conversely flying at El Paso, in the rarefled air due to an ele tion of 3.980 feet. Hamilton found at first that he could tion of 3,800 etc., Hamilton found at met chain tee of mot set off the ground at all. The sustaining planes were lengthened, and 135 square feet were added to. the normal area of 250 square feet, with this increase, the machine rose, and successful flights were accomplished. As the result of this experience, Hamilton believes that records of high fring in which, the ma chine reaches the rarefled strata of air, should be cepted with considerable eaution

Not very long ago, timber was selected entirely according to its external appearance. The diameter and length of the piece, the straightness of grain, sometimes the weight, sufficed to determine both its nmercial value and its destination. At that time, on account of the difficulty of transportation, woods of local origin were almost exclusively employed. It is very different nowadays. With the increase in consumption and the decrease in the local production or any varieties and the decrease in the local production of consumption and the decrease in the local production of the the exact determination of the structure of wool. The compound microscope is now used for the minute and careful examination of longitudinal and transverses sections of a specimeno of timber, the compared para and the proper industrial supplement of which it is desired to determine. Prheyrian and timble-saled cells sustry the solidity and resistancy which are brea-tering the solidity and resistancy which are brea-tering the solidity and resistancy which are breat-ced to the solidity and resistancy which are neces-patible with the solidity and resistancy of paraging and the silled with density of the solidity and the solidity and the silled with density of the solidity of the solidity of the silled with density of the solidity of the solidity of the silled with density of the solidity of the solidity of the silled with density of the solidity of the solidity of the silled with density of the solidity of the so

### **AERONAUTICS**

Cept. Beldwin and Joseph Seymour both gave ex-silent demonstrations on the 4th instant of their pro-Sciency in fiying their machines. The latter's biplans is a standard 25-horne-power Curties, while Capt. Bald win has a Curties machine with a tail like the Parwin has a Curtiss machine with a tail like the Far-man and with a chain-driven propellar placed back of the planes and connected to the 26-horse-power mo-tor. The propeller used is somewhat larger in diam etse and of higher pitch than that ordinarily em

Freques de Lessage crossed the Channel on the Sist day of May by way of Calais to Dover with a Birch of the Change Started from the same devo-trace. Count de Lessages started from the same devo-trace. Count de Lessages started from the same devo-ser and the Changes started from the same devo-ser and the Changes started from the Sister of a Barraques, near Calais, from which Birch assented on his memorable flight. The Oout ascended to unitaries to four o'clock in the presence of \$300 apec-tators. His motor was a Guoun, revolving-quinder on gine of 50 horse-power At a height of 1,600 feet he was lest in a heavy fog The torpedo beat "Escopetta," which performed a similar service for Blériot and wanca performent is similar service for literot and Latham, accompanied him, but found it impossible to keep up De Lesseps was unable to adhere to his course, pertly perhaps because of the for, and as the "Escopetta" entered Dover, no one knew any thing at all of De Lessepa. He had landed about two miles to the north of Dover, near St. Margarut, and glided down a distance of about two miles after shut ting off his motor. He alighted at twenty two minutes after four, after a journey of forty-two minutes.

After Count de Lesseps's flight across the English Channel with the Biériot monoplane on May žist (which was the second time this trip had been made by any acroplane), the Hon Charles Stewart Rolls, who was the first Englishman to fly with a Wright

by any serophase), the Hon Charles Stewart Rolls, who was the first Englishman to fly with a Wright who was the first Englishman to fly with a Wright Crossing From Bagiand to France and return. The crossing From Bagiand to France and return The State Was made near Dover at 6.0 P M., and Mr. Rolls covered the 31 miles to Sangatte near Casis in 35 minutes. After circling vitice above the cliffs he returned to England, and landed some distance from the coast. After circling vitice above the cliffs he returned to England, and landed some distance from the coast. After circling vitice her covered some 65 miles made and the state of the England Company of the Engl present with his started to Mr. atarded to Mr. distance from the whorst board of the properties of

Feguant and Capt Marconnet on a Henry Fart plane Starting from Chalons at 4 40 A M the offi cers flew 176 kilometers (1984 miles) cross country to the artillery park at Vinces s, which was reach at 7 10 This flight of two and one-half hours' dura-tion was accomplished at a gpeed of 43% utiles per hour. Capt. Marconnet was able to take photographs and make sketches that would have been of great c interest in time of war. This is the fire practical demonstration of the aeropiane for scouting purposes, in addition to its being a new world's rec ord for cross-country flying with two men in the ma Another French aviator, Labouchère, flew for ten minutes with two passengers at Mours

Previous to attempting a long-distance flight from New York to Philadelphia and back, Mr Hamilton gave some beautiful exhibitions of his skill in flying at Mineola the first week in June He would rise to a height of from \$00 to \$00 feet and circle about, at a sequent or from sou to 300 feet and circle about, at the same time swooping down to within 15 or 20 feet of the ground and suddenly rising again. When he was about to slight he would shut off the motor at a good height, and dive almost perpendicularly to the earth. When only 10 or 13 feet from the ground he would level up his machine, and make an extended gilds only a few feet above the surface. He appeared for ride in the hiphane as eastly and with the same skill that a harback rider rides his horse, and he assemed to take as much subjournent from his dives and oblase pranks as did the large number of interested opener pranama as one the targe number of interested projectors. The machine be has used since last win for in the identical racer used by Mr. Curties at lightness. It is very fast, and has also demonstrated the delicity occurry two possible, since for Hamilton took with a fine of the contract of the contract of the contract and the contract of the

### SCIENCE.

Prof. Dr. Margasell, of Strasburg, president of the International Commission on Scientific Aeronautics will accompany Count Zeppelin on his expedition to Spitzbergen this summer, and will carry out a series erological observations in that vicinity. For this on it is proposed to hold the "international week" of kite and balloon observations, in which meteoro-logical institutions in all parts of the world partici pats, from the 8th to the 13th of August, this year, natesd of during November, as previously inter

Bernard Brunhes, director of the observatory of Puy-de Dôme, and professor of physics in the faculty of sciences at Clermont-Ferrand, is dead at the age of 42 He was the author of many memoirs on phy-sical and meto-cological subjects, and of late had been prominent as the champion of the new methods of weather forecasting introduced by G Guilbert of Carn weather forecasting introduced by G Guilbert of Casm Frunkas endeavored to explain on theoretical grounds the methods deduced empirically by Guilbert, but the extensive polemics on this subject in the scientific journals have not led to any conclusive results

A fund has been established by Mrs E H Harri A fina has been established by MIR DI I ITELLIMAN for the collection of complete data on mammals and other animals of the North American continent Dr C Hart Merriam chief of the biological survey of the Department of Agriculture, will resign from the ernment service to take charge of the work. The Mr Harriman was intensely interested in natu It was with his financial support that Dr Mer riam visited Alaska a few years ago and collected data which added much to our geological and biologi cal knowledge of that region

Attempts are being made to produce textile imitations, equal or superior to natural furs in color, gloss, and adaptability to the ever-changing dictates of fashion, and very much cheaper The substitution would have the further advantage of releasing the natural skins, especially goat skin, for use as leather Mohair and other long-staple wools are most suitable for this purpose A recent issue of the Faerber Zei s a detailed description of the promaking imitation furs, including the operations of

toring, dyeing with acid dyes, precipitating manga-dioxide on the fibers, steeping in aikali, and aforming the bisire shade produced by the ma

dorming the bitter stade produces by the second diodide into green, blue or saryals haven has long been well known that the rural possible is superior to the population of the cities, and population of the agricultural easiers provinces of transp. is superior to that of the manufacturing seen provinces in regard to fitness for military fee. The forty-one large cities which contain out of the entire population of Germany, furnish only green the control of the control Pomerania 123 per cent, Saxony 134 per cent average height of the recruits from the north of G many exceeds that of the recruits from the south The average height for the whole empire is 60 inches the average for Mecklenburg, Schleswig Holstein, and Oldenburg is 66½ inches, and the average for Saxony and Silesia is only 6514 inches

Carborandum, which consists casentially of silicon carbide is produced in the electric furnace from a mixture of sand, coke, sawdust and common sait. V the exception of the diamond, carborundum is the hardest of all known substances, scratching even corundum, which is the hardest of natural stones except the diamond The commercial production of carborundum was first accomplished by Acheson, and the Carborundum Company which he founded pro-duces in its works at Niagara Falis large quantities of carborundum, which is in great demand as a polishing and grinding material. The carborundum hitherto produced contains a trace of uncombined carbon and consequently has a dark brown or black color, which makes it unsuitable for decorative purposes Recently idum Compa has devised a method of producing coloriess and trans parent crystais of carborundum, the refractive of which is said to be even greater than that of the diamond These crystals are produced by charging the furnace with a mixture of 30 parts of pure carbon, The turnisce with a instruct of sawdust, and 4 parts of sawdust, and 4 parts of sait. All trace of color is removed from the crystals by the addition of a small quantity of a metallic oxide, such as oxide of chromium As the refractive power of the diamond is one of its most valuable properties, and the carborundum crystals possess this property in a still higher degree, these new gems may become serious rivals of the diamond, if they can be produced in suitable shapes and sizes, and can be cut and pol-ished like diamonds.

## TELEPHONIC STETHOSCOPE

BY THE ENGLISH CORRESPONDENT OF THE SCIENTIFIC AMERICAN

Telephone relay with caring removed

Great is terest has been center d among British tele honic and medical circles in the interesting device phonic and medical circles in the interesting device invented by Mr S G Brown which was recently de writed before the institution of Electrical Engineers
The vital feature of this invention is the siccessful The vital feature of this invention is the accessful perfection of a telephone relay. For many years in ventors have been trying to develop such a relay but have been harded by difficulties which many engineers have declared to be unsurmountable. As the outcome of aty years patient study and experiment however Mr. Brown has achieved success as test over the truth telephone lines of Great Britain have striking the contraction of 
This risy will his shown in the accompas-ill stration and the design of which may be gain from a reference to the explanatory diagram is

veloped upon entirely new lines and is based upon the researches of Prof J J Thomson Earhart Kins ley and others concerning the flow of electrons across proscopic air ga; between two conducting surfaces at different potentials. Earhart found that when the metallic circuit is broken by a minute opening of the order of 0 000 000 5 centimeter and the metal at tao creer of volvo outs centimeter and the metal at the point of interruptin is platinum the current will flow round the circuit and across the opening and when this interrupting space which he Brown terms the conduction space is slightly altered in length the resistance is varied and the value of the current flowing round the circuit is greatly affected. This constitutes the fundamental basic of the Forence in constitutes the fundamental basis of Mr. Brown a in waition for he points out that this conduction agace is just what is wanted for the current carrying device of a telephone relay where undercoppic mechanical movements have to be converted into large current changes. But the dimensions of this conducting space are so minute that it is a difficult matter to insure and maintain it by mechanical means. Therefore he deviced a method whereby the current flowing secreta the conducting space device tia own advantages occus the conducting space offects the own advantages. are devised a method whereby the current nowing across the conducting space effect its own adjustment in very much the same manner as the current that passes through an lectric are lamp strikes and main tains the length of the are In the disgram Fig 1 there is a permanent mag

In the disgram Fig 1 there is a permanent map on X which is continued by soft true poies right up to but not touching the invar select of cell windags H and X are we would round these soft irres pole obtained as and its release before current to be magnified errollate round the winding H and conceptually by upgring the magnetism set the reed P in wheatigh. Shere are top and bottom metal contact places M and C owhich are opened to an infe-

itesimal degree by the fine adjusting screw W, and by the action of the local current passing through the contact and around the winding E it is the action of the local current operating through this winding which forms and subsequently maintains the conduc

which increase here experienced particularly per fact that the intrument may be torsed upside down and yet produce scarcely gar appreciable later atton in the value of the local curvent and certainly of the value of the local curvent and certainly of the value of the local curvent and certainly of the value of the solid curvent and certainly of the value of the solid curvent and certainly of the value of the said of the value of value drop of thin oil

### NEW SYSTEM OF COLOR PHOTOGRAPHY

ve plaie within the last three years, upon . . . yagan a composes over power is mass at one opera-tion direct for the camera, quits an importus has been given to improvements in this line, which will over-come set of the drawbacks of the French process that is, the difficulty of securing duplicate color pho-tographs except by meccasive expectives in the

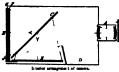

The new system we are about to describe has this particular fusions, that duplicate color pictures can be obtained and Mbless from the first negative obtained in the camera. It has been perfected and simplified in the camera. It has been perfected and simplified th the camers. It has been perfected and simplified by Mr Frederick H Ives of this city and is quite waigue in the way certain apparent difficulties are

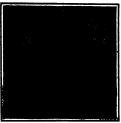

EMPLIES IN the Way certain apparent communions are personance. The processing is bessed on the merging of the three primary colors, red. Situs, and group it is not quite as simple in operation as the autochrones process that processes the fellowing defaults developing recently when the process of the process developing account of the sensitive pieces and keep better developing are constailly when netwest imports old and cost but half as much as the autochrome plates the positive trans-parentess are made by a separate process from the inlabel aspatives, thus permitting the making of any number of duplicates the transparencies transmit many times as much light as autochromes and are quite free from granularity so that they are perfectly adapted for use along with ordinary instern sides in the instarts also for use in the storeacopes the pro-oses also permits of local treatment to modify the colors when and where desired with autroordinary facility a feature which will be greatly appreciated by the artistic unstern as much as the autochrome plates the positive trans-

facility a feature which will be greatly appreciated by the artistic amasteur. A special camera is required to make the triple nega-tives but it is very simple and can be used without change for all ordinary kinds of photography with plates or films

When it is desired to make a set of triple negatives for color photography a trickmental plate and consisting of three sansitized plates held together as one is used in the special plates held together as one is used in the special plates be loider instead of a single plate and is so disposed in the camera after the plate holder has been inserted as to professor together three negatives representing the three perisary colors. The plate pack consists of a red sensitive and a green sensitive plate which is altaged thereto a sacking eard and a blue-sensitive plate which is hinged thereto a part of the plate holder the red and green-sensitive plate has been as a sensitive plate which is a larged thereto excluded. Simpained fills we parting on the life the bit-sensitive plate is made slightly shorter so that it falls or passes outward between the ledges. Which the obseque slide of the plate holder is withdrawn in preparing for an exposure this plate falls outward into the camera resting on the bottom of the latter in a horisontal position at right angles to the other plates When it is desired to make a set of triple negative ontal position at right angles to the other plates a horisontal position at right angies to the other plates After this a yellow screen plate is dropped down from the camera roof by means of a lever on the exterior as shown in the diagram and the usual compensating corem is placed over the lens tube. Then the ex-posure is made by means of the lens shutter which is

said to be about as long as that required for an autochrome place. Referring to the diagram, A is the lens having a compensating color screen B attached to it which equalism the exposure for the three images and perfects the color selection  $\mathcal{O}$  is a hinged transparent

The centre, physicider and carrying con-

The plate helder is inserted at the back of the camera under a ground glass frame held by springs is the usual way Focusing is done by moving the leus

the mean way Focusing is done by moving the lens inward or outward through a tube on the front. It is evident from this arrangement that the image-on each plate must be exactly the same but that two of them will be reversed one by reflection and the other because made through the glamp side of the plate

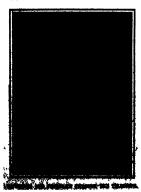

plate In making positive duplicates on the film it is only necessary to reverse the position of the print from the positive-positioned negatives to make all three positive prints evincifed when bound together between two glasses to form one harmonious transparent colored picture. The colloid no positive film is so this that accesses registration of the three films is not contain a colored print of the colored prints.

sflected. The exposed plates are developed by time development as a unit held in a special rax they being asparated opan. Hilke the leaves of a book in a special rax they being asparated opan. Hilke the leaves of a book in a time show no color but contain the rotior reveal times above no color but contain the rotior reveal properties above no color but contain the rotior reveal any time for making natural color prints the three To make the transparent color prints the three reactives are placed side by side in a printing frame A sheet of colloction bearing a canting of birhromated above to colloction bearing as canting of birhromated the colloction is dedown on the negatives.

the back of the printing frame put in and then ax too back of the printing frame put in and then as posture made to light through the negatives—about one minute in clearest smulight. The exposed sheet is then removed from the frame champed coated side up on a posture of the coated side up on a say for a few seconds. This gives two removes tay for a few seconds. ## WIRELESS TIME SIGNALING TO SEA FROM THE EIFFEL TOWER

## BY F HONORE The wireless telegraphic station of the Eiffel Tower is now signaling Paris Observatory time to all vessels

is now signaling Paris Observatory time to all vessels within a rodius of 1800 miles. The present station is using 15 to 16 borse-power When the new installation whose completion was delayed by the recent floods is finished 100 horse-power will be at the disposal of the employers and the range will be doubled. A master clock which has long been used for the correction of marine chromometra is set up in a room of the observatory side by rides with block that tole graph mean time to various contern in Faris and graph mean time to various centurar in raris and deferred clocks which serve to requists this mean time. The master clock in question itself indicates mean time with reference to the meridian of Paris. Inclused in a giase case and suspended from a wall so hisk that vibrations in manoury and variations in tempera-ture cannot affect the mechanism it is corrected each that viprations in masonry and variations in tempera-ture cannot effect the mechanism it is corrected each day if necessary by means of a magnetic regulator. The rod of the pendulum carries a magnet the lower and of which is spaced a few millimeters from a solen end of whon is spaced a rew minimeters from a sown old. Depending upon the direction of the current which is sent through the sciencid, the magnet is at irmstad or repelled thus retarding or poselerating the best of the pendulum. In this manner a lost second is regulated in thirty-six minutes.

The clock is connected by wires with the key of the vipules station of the lifeli Tower At midnight and lifeli, and at 12 64, the clockwork automatically

STATE WHITE AUTOMATICALLY TRANSPORTED TIME

completes a circuit, thus actuating a Morse key and

complete a circuit, thus actuating a Moree any ma-cantaing Heritain waves to be emitted. The observatory (seef its not equipped to seed wire-less signals but it receives the by means of a small serial connected with telephonic receivers. On the other hand by means of a More, key in the circuit of an ordinary belegraph system independent of the clock the wireless apparatus on the Billiel Tower can

clock the whreless apparatus on the Sillel Tower can be operated from the barvator.

At the proper time each day an official does a tel-phone beadpiese and proceeds to the work of notify lag vessals at sea of the orrect time. One finger on the Mores key but ye gived to the end of a reading telescope the official watches the beat of the pendulum All 11 of he of present the key and by means of agreed signals of the control of the pendulum of the control of the control of the control of the pendulum of the control of the control of the control of the pendulum of the control of the control of the control of the pendulum of the control of the control of the control of the control of the pendulum of the control of the con signals the h ur This transmission of time is re p at I twice as we have said namely at 12 03 and at 13 4 preceded y other combinations of warning sig-nals. Hence vessels receive the time thrice in five

The officer on board the vessel at sea is similarly quipped with a telephone headpiece and he watches e hro ometer instead of a clock Making due allow suce for jossible errors of observation he estimates the error of his chronometer

# The Flights of Rolls, De Lesseps, and Curtiss Compare

BY CARL DIENSTBACH

The "beavior-than-air machine' during the past few weeks has proved mearly as useful as the large modern airship, that has aiready been commercialized When Biferiot first fiew across the English Channel, swroplane Biferiot first flew across the English Channel, suroptane traffic seemed near But as nobody, not even his rivals in that attempt, repeated the feat, his perform-ance gradually lost its convincing quality. In Ger nany his feat was dubbed a "mere piece of good luck When, however, during the last few weeks, the Chan nel was not only crossed again on a Biériot machine,

nel was not only crossed again on a pierro measure, but in quick succession the whole navigable length of the Hudson was covered in a splendid high-speed flight, and spiendid high-speed flight, and when on the heels of that triumph the Channel was crossed and re-crossed in a single flight, everyone realised that the aeroplane had on tered upon a wider field of useful nd that it was indeed a vehicle which is destined to be the pleasure conveyance of the future The three flights mentioned were all over established routes of the liveli est traffic They all required a ma-chine which would not fall, under ceime which would not rait, under penalty of falling into the water, and they were all between rocks or precipitous mountain sides, which made it a problem to land in case of emergency, and which influ enced the air currents in a way as yet so little known that even a sephyr might become formidable aspayr might become formidable That they were successfully accom-plished by machines of so widely different types as the Biériot mono-plane and the Curtiss and Wright biplanes shows to what extent the technics of flying machine construc-tion have advanced witch the basition have advanced within the pe year They especially emphasise the immease progress that has been made with regard to the heart

been made with regard to the heart of an aerojalane—Its motor It seems now certain that the aeroplane motor will merely repeat the history of the automobile on gine It offers certainly a more corrulable problem, but it seems now assured that the continuous filters of the certification of the certificat now assured that the continuous falling of the early flight motors was due less to the inherent diffi-culties under which they had to work—running almost continuously at top-load—than to inexperience of at top-load—than to inexperience of the makers it should be pointed out that the Curties and a Biériot machine aithe fiew with half the power with which they were provided for these trips. They were not larger than the standard type-but De Lessops had a 50 horse pow but De Lesseps had a 50 horse pow or Guome motor in place of the 24 horse-power Anzani with which Bidriot flew across, and Curtiss also a 50 horse-power eight-cylinder motor against the usual 25 horse-power four-cylinder engine of a Curtiss biplane Capt Rolls had made no attempt to double the mo-tive power of his Wright machine, but as he was flying alone he had considerable reserve force at his considerable reserve force at his disposal Tarse were all machines capable of carrying a passenger, but flying with only the pilot aboard Consequently the motors were not running continuously under top-load any more than automobile

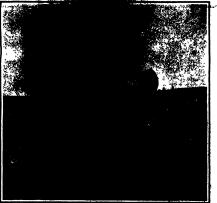

der top-tona any more than automobile income. Count de Lessepa used his power sparingly He made little better time than Blériot. Even Curtiss, who was beating the "Twentieth Century Limited," says he rarely opened the throttle wide

There is another feature common to these flights, to es must be ascribed just as much as to more reliable motive power. It is the evolution of high flying. For trips of this nature a great elevation has the very obvious advantage of easy reckohing. De Lesseps flow in a fog, yet, in contrast to Biériot, he almost always in sight of land, at an altitude of was animed aways in signs of stand, at an attitude or a thousand feet, as compared with Bifrico's 200. From the same superior level Curties saw the scenery perced below thin like a clear. He could make short cuts, pick his landings, and easily decide where belt to lay his course. Firing bigh greatly simplifies the plicit task, where low firing would add to the difficul-

ties of balancing, the difficulty of following a more or less circuitous course while dodging obstacles, it is means something like the strain on a hyerde rider, who with his eyes glood to a country road, tries re-centantly to pick out a path. Though a flying pitch does not fear actual contact with objects below there still remains the need of allowing for leavely not of wind causts, irregularities of the motor or swaying the machine The principal advantage of being also go high is, however, in the increased "range" it gives to dominating the last itself.

College College College

De Lemops in his Bieriet menoplane flying across the Chambel. THE SECOND AND THIRD ARROPLANTS TO FLY ACROSS THE RESERVE GRANNEL.

Aviators are fast realising that it is better to equip aerial disturbances than to fight them. This tends is prevent them from following any route that approach the confined character of a readway. The real shie issues of flight may be found only it the 

doubt isuraid this trick while The Hudson River is known water. He had no do

cellars vaguely suggest of old carties. If we bright Sonday when Curtist his epoch-making Sight to York, the greatest safety for the water in such a rive

As a feat of nitrigation Curtiss light excelled De Lessings an Rolle's journeys across the sec. If had to deal with much more varie had to deal with much more regime conditions of the air, just as change ing as the topography of the light scape over which he was possible it is not preprising that on his It is not sarprising that on his long trip he secontraved that hughest of the aeroplants, decombine outwents, that was more familiar to aviators in the old days will deal to aviator in the old days will day will deal to aviator in the old days will day will deal to aviator in the old days will deal to aviator in the old days will day wi peen sought, titining in a sam is so uninteresting, the machine in "dead air" seems so inert imd devoid de power, that Littenthat, Phoffer, "levring, and Avery gladity pre-ferred to risk the gusts instead. Curtiss only reiterates what Her-

ring fourteen years ago so elo-quently described, when he raters to a feeling at the pit of the stom-

questry described, when he ruders to a feeling at the pit of the storiach lithe that caused by a quickchange in the level of flight of 
twenty to forty feet.

The presence of a submarion beat is sometimes made known to the enemy by the train of bubbles that rese to the surface of the water from the gasenatine ac-hast. These bubbles are residily discernible, and indicate the course which is being pursued, thus ma-abling the enemy to take measures for defense or a counter attack. In order to prevent a submarion beat from befortying its course in this way, an inventor has devised a method of relating the exhaust game, pur mitting them to escape only at triguilar intervals in The pre mitting them to escape only at irregular inter

UNIQUE CONCRETE PERCE POST

rge quantities. Although the single large gas bub-e thus produced would indicate the position of the bmarine, it would not give any information as to the direction in which it was traveling or its rate of speed direction in which it was traveling or its rate of speed. The exhaust games of the engine are led to a gas puri-fer and cooler, and then enriched with oxygen and passed through the engine again, so that the engine works in a closed crycle. An automatic valve serves to carry out the games, when they reach too high a pressure, and remnite them to a receptacle, whence are related to the control of the control of the con-trol of the control of the con-trol of the control of the con-trol of the control of the control of the con-trol of the control of the control of the con-trol of the control of the control of the con-trol of the control of the control of the con-trol of the control of the control of the con-trol of the control of the control of the con-trol of the control of the control of the con-trol of the control of the control of the control of the con-trol of the control of the control of the control of the con-trol of the control of the control of the control of the con-trol of the control of the control of the control of the con-trol of the control of the control of the

In case of fre, so the time-honored directions run, throw a mattrees out the window and then jump down on it. As a mattrees may not always be handy, as inon it. As a nativese may not always be handy, an in-ventor of this city proposes that fire companies be equipped with mattress trucks for the accommodation of these who have been traupled in a burning build-ing. He has invented a truck provided with a plan-form which carries a series of bed sortings and mat-treases and which, when brought to the seven of the fire, may be elevated to a considerable height, and the second-story windows, and moved inward toward the building so as to bridge over the arressary bris instance can then leap from their windows to the matterss.

There is nothing a fireman dreads more than which produces volumes of dense amoke, for it is im possible for him to get near enough to the seat of the fire and to see clearly enough to direct the stream of water properly Various devices to enable a fireman are and to see clearly snough to direct the stream of water properly 'Arious derives to enable a firman to breathe in such conditions have been proposed from time to time. A novel scheme of this sort has just been patented. It consists of a pair of beliove occu-nected to a water wheel in the besse near the bydrant, and operated thereby to open and close alternativity. Preach air is thus pumped through an auxiliary plo-conducted shoug the main home to a mank which is wan by the frequent.

is customary to force the growth by covering the beds with glass. This is rather a cumbersome process, as it involves the construction of frames over the plants, which must be dismantled before they can plants, which must be dismantied before they can be removed to a new location. Furthermore, the besting device that is sometime employed must be moved as well, which is rather an expensive operation. An improvement on those conditions has been suggested recently it consists in the use of a portable greenhouse and a separate portable besting plant, which may be connected to the hesting plant which may be connected to the hesting plant which may be on the greenhouse in mounted on wheely, which travel on tracks or ways. The ways are semporarily haid whom moving the greenhouse from one place to another

porarily had whom moving the greenhouse from one place to another.

Two interesting patents on drinking cups have re-critly been lessed One of them provides a folding-pocket drinking cup, which consists of a place of fixible asterproof material folded upon itself to form a cun without any sessus through which the water may less. The cup is covered by a strip of testher, and may be collapsed to form a fait necksage, so that it other cup referred to is Angived particularly for use other cup referred to is Angived particularly for use at welds foundating and public dispensaries of beverges it is formed of a hand of parafice paper connected by It is formed of a band of paraffine paper connected by an overlapped joint. The bottom of the cup is made out of a star-shaped blank, the points of which are folded up on the sides of the cup, and serve not only to attach the bottom to the cup, but to reinforce it The cup is made of tapering form to permit of nesting

Mr Dexter M Rogers, of Boston, Mass, has dedi-cated to the public an insect-destroying bomb upon which he has just secured a patent. The bomb contains dry poisons in powdered form, and is arranged to be exploded when it reaches a certain height after in ing discharged from a gun. The poisonous powder is thus distributed in the air, and gradually settles is thus distributed in the air, and gradually settles down on the leaves of the trees which are infected with the insects. This method of freating the trees po-sesses the advantage that the powder will reach all parts of the foliage, and is applied with a great gaving of time and labor

PATRITED ODDITIES.

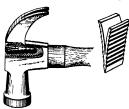

GUN BORE SIGUETIAN THE ARCHYA—A rather ingenies method of testing the sightle of a gun has recently patented by a German inventor it rousists in page the telescope in the bore of the gun, with its like

TELESCOPE FOR TRETING GUN SIGNYS,

sight parallel to the axis of the bore. The sightling device is then set to its sero position, and the gun aimed at a distant object. The eye-piece of the take scope, which is shown in the enlarged sectional view, is fitted with a prism, so that the axis of sight inter-sects the line of aim at the eye in this way it is possible to make an observation by merely moving the eye to change the direction of vision, as indicated by the broken lines, whereas heretofore it has been necessary to move the head or even the entire body, in changing from an observation along the sights to one

Richitive Wisher For Tool Handles—An invento in New Moxico has recently hit upon the ingeniou scheme of using a resilient wedge for fastening th

pendently of these therma: meas nts. Nordmann's method, in con with the spectral analysis of ves information concerning their rative stages of development. These by high temperatures explain the t in some of the stars the spe pe reveals the existence only of ele the like hydrogen, nitrogen and car and the compound of carbon. and the compound of carbon and ogen called cyanogen, which is in ciable by heat

rdmann's apparatus also many new prospects in photometry, a missione which is still in its infancy, ex additioned which is still in its infancy, or, the still is a season to stellar radiations, and the season and the season and the season and the season and the stillar radiations, the season and the stillar universe of the constitution of the stellar universe of the constitution of the stellar universe of the constitution of the stellar universe of the season and the stillar universe of the season and the stillar universe of the season and the stillar universe of the stillar univers mers have thought less difficult to follow than it really is In determining stellar magnitudes, the American and Gorman observers muraly measured with the photometer the total luminosity of each star, but, as the stars are of different colors, the values thus obtained are af fected by errors of physiological origin Furthermore, it has long been known that estimations of the brightness of variable stars, especially red stars, exhibit great individual differences. A com noni great individual dinerences A com-parison of the catalogues of Harvard and Potsdam shows differences in the record-ed brightness of red stars. If in one se the ratio of the brightness of a med star to that of a white star is resented by E. it will be represented in the scher catalogue by \$/2E. These system atte differences appear to be due to two distinct causes. The first source of error purely physiological and consists is the fact that sensations of color are produced by the excitation of the termina finments of the optic nerve, which line the retine, and which are of three d ent sorts, sensitive respectively, and a most exclusively, to rays of the red, the green, and the blue and violet portions of the spectrum. Now this relative sensihe spectrum. Now this relative sensi-teness varies greatly in different indi-shible, as is strikingly illustrated by the physics and pathological case of Dalton-im, or odor blindness. The lumipous spreases the pathologism case of latton-man or color blindows. The lumiposes admitted produced by a gives star, that makes the color of the latton of the color special produced by a give star, that special colors in different individuals. The second casting of error is found, ap-parently, in the phenomenon discovered by Particips, which pays be expansed as follows: If two sources of light, one him and the other red, appear equally bright to the error, and if the brightness of each nowne in the dischalated in the same proportion, the red light will appear less special than the latter The redirect of the color of the color of the colors of the special than the latter The redirect of the special than the latter The redirect of the special than the colors of the colors of the special than the colors of the colors of the special than the colors of the colors of the special than the colors of the colors of the special than the colors of the colors of the special colors of the colors of the colors of the special colors of the colors of the colors of the special colors of the colors of the colors of the special colors of the colors of the colors of the special colors of the colors of the colors of the colors of the special colors of the colors of the colors of the colors of the special colors of the colors of the colors of the colors of the special colors of the colors of the colors of the colors of the special colors of the colors of the colors of the colors of the special colors of the colors of the colors of the colors of the special colors of the colors of the colors of the colors of the special colors of the colors of the colors of the colors of the special colors of the colors of the colors of the colors of the special colors of the colors of the colors of the colors of the special colors of the colors of the colors of the colors of the special colors of the colors of the colors of the colors of the special colors of the colors

star and the aperture of the telescop Additional complications are introduce by the age of the astronomer the position of his eye in respect to the eye the degree of ocular fatigue, etc. eliminates these errors in the determina tion of the total luminosity of stars makes possible an exact study of the colors of stars and of the dispersion of light in interstaller space Finally, it will undoubtedly give information con-cerning the intrinsic mechanism of the strange and mysterious transformations of variable stars of all classes

Dr Franz Linke director of the Me-corological institute of the Physika-scher Verein at Frankfort-on the Ma.n. has published a report on the special storm-warning service that he organized last summer in connection with the inter service, being the first of its kind, was exportmental, but proved so successful that a similar undertaking is likely to be a feature of all future aeronautical competitions on a large scale, especially if held in a region of frequent thunder-

The prediction of large general storms services that now exist in all civilized ountries Local storms, however, and difficult to forecast on the basis of the widely scattered reports that make up the ordinary weather map and that are all that the forecaster ordinarily has at his command The attention of the fort service was directed especially to the prediction of thunderstorms. The life history of these storms is now well understood thanks to the brilliant in vestigations of a small group of me-teorologists of whom M Durand-Gréville is the most conspicuous. In the great majority of cases they aween across the country in a long line that may be compared to the front of an advancing army
—the "thunderstorm front"—at a speed averaging, in Europe, about 40 kilometaveraging, in Europe, about 40 kilometers an hour The line of advance keips a position more or less parallel to itself, and its progress is not difficult to preddet, if its oxistence and position are known at any given time. The prerequisites of successful thundrestorm prediction are a dense network of reporting stations and a session of accounts tole.

graphic communication with the central Dr Linke engaged the services of fifty five observers constituting a picket line of 150 kilometers radius around the city of Frankfort These were mainly recruited from among the volunteer ob cruited from among the volunteer on servers already reporting, but not by telegraph to the existing meteorological institutes of Southern Germany These persons were requested to send an 'urgent' telegram to Frankfort whenever a thunderstorm or a wind-squall (which is first-cousin to the thunderstorm) ap-peared in their vicinity between the hours of 7 A M and 7 P M The compensa-tion offered was a free entrance ticket to the exposition and a copy of the pub-

stations and a system of adequate tele

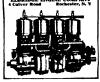

The result of these arrangements was most gratifying, as, with one or two exceptions, all the thirty-seven thunderstorms that reached Frankfort during the three months of the exposition were duly hersided an hour or more before their arrival

It is noted that no air rait attempted to fly in the face of providence—and the weather forecaster—except the big Zeppelin," which began its famous voyage to Cologne against the advice of the fore easter and promptly ran into a heavy

The entire cost of the service was only 800 marks (\$150), an insignificant amount compared to the value of a single lives of aeronauts, an effective stormwarning service accordingly offers a cheap form of insurance

a dissolving the injunction granted in favor of the Wright brothers against Curtiss, by ludge Hazel and the similar injunction granted by ludge Dand against Paulhan the Chruit Court of Ap penis has simply followed a long established precedent th patent law. As a general rule preliminary injune tions are not countenanced in patent case even by lower tellumals. The reason penet for to seek. Rarely indeed is intringement so charity established that a court is justified in restraining the manufacture and use of an invention is fore the question of patent valid fty is decided. The practice is in every way commend It preliminary injunctions were granted without entering into the question of validity many an honest efendent's business would be crippled until after verse of linguitien his legal rights are clearly defined

The inrightly which results from too great a readings on the part of a lower court to restrain an alloged between is excellently illustrated by this very in on which the Wrights obtained against C and faulhan. As a result of the interlocutory decress and I authan As a result of the interlocutory servess of ludges Hand and Hazz it he Wright brothers have controlled flying in this country for the last six months. I niews he filed a bond with the court, no aviator who used a machine equipped with alterons or wing warping devices operated in conjunction with a vertical rudder could make sell or fit his appa latus in this country. It is far from our intention to ensure the Wright brothers for the attitude which they have taken. They are in every way justified in seeking to uphold their patents and in defending rights which unestablished as they are as yet from a legal point of view are nevertheless the fruit of pains-taking experiments extending over years. Probably the counsel of the Wright brothers themselves were uch astonished by the willingness of Judges Hand and Hazel to grant injunctions against Curtiss and Paulhan as the patent profession at large Curtiss at least was a successful aviator before the Wright brothers decided to cast aside all secree; and to show the world what manner of machine was that of who performances they had darkly hinted Blériot, too, had been pluckly experimenting for some time before the Wrights flew in public. Curius was using hinged wing tips in his earlier machines with which he made public flights antedating the open flights of the Wrights. It is autonishing that the lower court should have failed to find in these facts a sufficient conflict of evidence to deny the granting of an in

With the reversal of the decision of the lower co e Circuit Court of Appeals, the developme aviation in this country is now unhampered Paulban Sommer, Blériot De Lesseps, and the rest of that during company of French aerial pilots, whose ex enliven the press dispatches almost every day, are now at liberty to enter this country and fly with out the fear of finding their hands and their machines tled by a sweeping injunction Moreover, American inventors will have the opportunity of improving exinventors will have the opportunity of improving ex-lating machine provided with wing warping devices, without fear of insurring a fine for contempt of court. Much as we should like to see justice done to the Wrights, we cannot but feel that the reversal of an injunction granted contrary to established precedents will be viewed with astifaction by every seconaut.

THE SCIENTIFIC AMERICAN ARRONAUTICAL TROPHY. PART from the value which will attach to the Sciettific American aeronautical trophy as indicating that its permanent owner has in three different years made the longest flight in the United States, the trophy will possess a strong

historical and sentimental interest as being absolutely the first prize of any kind offered in America for the encouragement of the art of aviation

In this respect the trophy must forever be unique in this respect the trophy must sorewer be unague among the countiess cups and prises which will be offered in increasing numbers during the years to come Cups which are won year by year for certain special events and pease into the permanent owner ship of the winner possess a value and interest which, however great at the time, must necessarily become local and personal as the years go by, but a trophy which carries the distinction of being the first to be offered in that early period of doubt as which marks the inception of a great and difficult art such as that of flight through the air must over poses a value all its own, which will inevitably increase with the lapse of time

In this connection, we wish to draw the attention of nirants for the forthcoming long-distance, cross-coun try flights, for which such generous prizes have been red to the fact that upon their sending a letter of notification to the Aero Club of America flights will receive official recognition and if the dis-tance covered should be greater than the seventy to seventy five miles (official distance now under consid-Mr Curtiss between Allians at intion) flown by Poughkeepsle, that contestant unless his record should be surpassed before the close of the year will be the ntrance fee or expense of any kind attached to such on cutty the sendous of a letter similar to that lo Mr Cuttiss which was published in the Scit 10th Asserts of June 10th 1910 being all that is neces

We wish moreover to take this opportunity secting the rather whitespread impression that the cur of he won three years in succession of fact there is no stipulation of this character itid If a contestant wins the cup three times he

# THE INTERNATIONAL UNION FOR CO-OPERATION IN SOLAR RESEARCH

tific critic were called upon to mention one of the most striking and important features of modern astronomical research it is quite likely that he would refer to the spirit of organized and practical cooperation which is manifested by ob servatories and astronomers. By evolving suitable plans for joint efforts to enable each institution to do plans for four source to ensure seen materials to the work for which by equipment and position it is best suited, and by sasigning through common agreement the particular part to be played in any given campaign, increased efficiency is secured, useless duplit cation is prevented and the entire project under pro cation is prevented and the entire project unifor pros-cution can be advanced symmetrically and rapidly. The photographic charting of the heavens, the obser vation of transits and total solar cellpses, the study of the variation of initiate, and the investigation of the shape and mass of the earth, are a few familiar instances of valuable cooperative effort by astron-

More recently there has been an attempt to secure a similar harmony of effort and collegation in the study of the sun, and in 1904 at the initiative of Prof. George E. Hale, director of the Mount Wilson Solar Observatory of the Carnegie Institution of Washing ton, there was formed among the visiting astronoms at the St. Louis Exposition an International Union f Cooperation in Solar Research. In the following year this Union met at Oxford, and in 1807 at the observathis Union feet at Votoro, and in 1879 at the operation of Mesidon in France. This year, on Asymut 28th, the members of the International Union will assemble at Mount Wilson, California, as the gueste of Prof. Hale and the Solar Observatory of the Carnogle Institution. This meeting should prove unique and memorable, for it may be doubted whether there have ever been assembled so many aminent astronomers in astrophysicists interested in solar studies as the who have accepted the invitation for the Mean Wilso

conference. That such a inchesizate in termity is presistation of the following mirrors of root, like and the shorrowing light direction will be generally admitted, but at the time these distinguished autonomers and physical content of the conten will be able to exemise for themselves this inte institution and its novel and powerful instrum te bi ans of which save rel new chapters in our in of solar phenomens have been written and still other discoveries, especially in the field of stellar evolution seem destined to follow

To most of the visiting scientists who never better have made the pilgrimage from Pasadena up the slopes have made the pligrimage from Passeesa up the slope of Mount Wilson the work of the Solar Observatory is familiar from accounts published in selectific periodi-cals No one is more welcome before Suropean as-tronomical societies than its distinguished director, who wheneve abroad is always called upon to de-scribe its progress. Therefore, it is not surprising that the conceptibility was afforded some fifty that when the opportunity was afforded, some fifty important astronomical observate ies and physical laboratories should decide to cross ies ann physical indovatories anoual decide to cross the Atlantic Ocean and the American continent to see and Larn at first hand of work in which they are inti-mately interested. While it is a source of intense antification to Americans that the Mount Wilson Observatory has become so pre-eminent in the brief space of some six years, yet it must be remembered that solar astronomy and astrophysics are prosecuted with vigor at other institutions and by numerous astronom it is this circumstance that makes of importance the coming meeting of the International Union

The value of solar work may be appreciated when is stated that the dry season at Kodatkanal in Southern India where there is maintained a large ob . Ivalory, corresponds with the rainy seas Wilson when of course the regular daily photograph ing of the sun is out of the question. With proper all angements therefore, it, is possible to obtain a continuous photographic record of solar phenomena. from one station or another on the earth's surface st in visual observation of the sun-spot specti is definitely apportioned among various observers, so that each group receives a portion of the spectrum for thorough study, the results of the various observations being recorded on a common plan Again, so impo in modern solar research has become the use of spi hellograph whereby the sun's surface or limb is photo-graphed in light of a single wave-length, according to certain deficte arrangements, that there is now an important chain of observatories from India across Europe and America to the Pacific Coast, where these instruments are in daily use. To record the amount
of the sun's radiation received at the earth's surface, <sup>10</sup> The sun's radiation received at the darks surrous bolometers and other heat measuring devices are em-ployed at various stations and continuous records are kept. In many cases it is quite obvious that local con-ditions may affect the observations and the records. Accordingly there must be simultaneous observations at a number of stations extending over as long periods. of time as possible. These are being secured with ever greater efficiency by the members of the Inter-national Union for Collegation in Solar Research. Buch cooperative action is not intended to destroy in itiative or originality in any observatory or astron-omer, but rather to encourage it. To-day a large number of observers are engaged actively in solar research, and in no department of astronomy is a greater amount of progress being made. This is all the more striking as it was only a few years ago, to use Dr. E E. Barnard's picturesque expression, that "the sun had almost been relegated to that limbo from which nothing new can ever come

Some interesting communications relating to the general study of the sarth were presented to the In ternational Geodetic Association, which may in Lo-don in September, 1909. The values of the oblateness and the equatorial glanater which have been deduced from the triangulation established by the U. S. Const rrom the trianguation eranimand by the U. S. position and Goodstic Survey agree closely with the values detained from European surveys. Prof. Rotres skilling tied a torrate plakings which registers variations of the force of gravity more rapidly then the pendar una, and with equal accuracy. Prof. R. E. Bernard informs us that on June 6th he obtained a very good photograph of Halley's comet. The plate showed the tail drifting off into space, and a new one forming in a different direction

The collection of fresh-water sponges of the U S National Museum is now being critically examined by Dr Nelson Annandale, superintendent of the Indian Museum in Calcutta, who is an accepted authority on this subject. Under the title of "Description of a New Species of Spongilla from China" there has just been issued paper No. 1737 of the Proceedings of the L B National Museum In this publication Dr Annandale describes as new Beongilla (Riratospongilla) streams which appears to be allied to Repongilla aspinosa Potts from which however it differs in its mpact structure and lack of flesh spicules m was found on rocks in the canal in southern Kiang Su, near Shanghai, China The type is in the collection of the U S National Museum

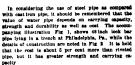

Prof. Megro of the University of Boulogne, has studied the radio-activity of dew The precipitation was made on glass plates exposed in immediate con-tact with the soil for several hours, beginning at about eight o'clock in the evening it is interesting to note that the water vapor was deposited entirely on the surface turned toward the ground while the cosite surface was quite free from any trace of disture. From Negro's experiments it would seem that, as in the case of snow and rain, the activity of dew disappears almost entirely in a very short time, use of mappears almost entirely in a very short time, which may be placed at not much more than half an hour. The maximum radio-activity is detected not immediately after the introduction of the plates into an electro-static apparatus, but some minutes after-wards, in which respect it differs from snow and rain

wards, in which respect it differs from more and rain in one of the Leopolchalu working as here of inflammable gas has been insufing at a depth of 1,500 feet, since August 1,900. The gas contains \$8\$ per cent of hydrogen, 44 per own of methano and 12 of other gases including neon and belium. The belium greatly prependentee over the mean but the two together forms about 0.17 pr. cent of the original gas, speller forms about 0.17 pr. cent of the original gas, speller forms about 0.17 pr. cent of the original gas, speller forms about 0.17 pr. cent of the original gas, speller forms about 0.17 pr. cent of the original gas, speller forms about 0.17 pr. cent of the original gas, speller forms about 0.17 pr. cent of the original gas, and the original forms that page 1.18 pr. cent of the sea which speller forms to the degradation of radium satisfaction of the original great stapped. He attributes the existence of the sea which speller forms the radioactive decomposition of as resulting from the radioactive decomposition of a strength of the present 
Mr. Austin Mobart Clark, an accepted authority crinoids, has recently published two papers in the Proceedings of the U S National Museum The first of these papers, No 1740, is "On the Origin of Cer-tain Types of Crinoid Stems" and in which he disses the probable relationship between the column of the crinoid and the central or sur-anal plate of the echinoid, and how widely different types of columns may be reduced logically to a primitive common an-cestor. Among his conclusions from the evidence he presents is that the stems of the recent and most of the fossil crinoids may be derived by supposing them to be the homologue of the central plate of the crinoid echinoid ancestor which has gradually become thickened and elongated and developed fransverse alternat ing fractures which have metamoruhosed into definite articulations. The second paper No 1743 bearing the title "A New Australian Crinoid," is a description of a new species which he calls Compsometra lacertosa and which was obtained at Port Jackson, New South Wales, by Mr J Bracebridge Wilson in the summer

The late Prof Garriott, of the U S Weather Bureau, was working at the time of his recent sudden death on a very promising method of long range forecasting, based on the observation of departures from normal pressure in widely separated regions of the world Telegraphic reports of the pressure at European and Asiatic stations are received every morning in Washington, and were utilised for this purpose of correlative meteorology"—I e, the interrelations of atmospheric phenomena in parts of the world farmente from one another—is now occupying the serious attention of meteorologists in all countries, and ous attention of notescriogists in all countries, and is one of the two mained between it the recent development of the countries and is one of the two mained between the countries and the set of the second countries and the countries of the second countries and the countries of the countries o

# MODERN STEEL LOCK BAR PIPE CONSTRUCTION

BY FRANK C. PERKINS

It may be stated that this capacity depends on fric

It may be stated that this capacity depends on friction, and rivered pipe presents an obstruction at arrivery rivet and every circular and longitudinal saam. It is also claimed that the uniform section of the lock har pipe without any obstruction of any kind from end to end of each length of pipe, matched private and the state of the state o

greater than riveted pipe or is equal to minimize well laid iron pipe

Tests on 30 inch pipe at Lockport, N Y, in 1909, showed a friction loss less than that given by Wat son's Tables for east-iron pipe It is well known that steel pipe is materially stronger than cast iron pipe During a cloudburst in 1903, two 48 inch riveted steel pipe lines carrying 50,000,000 gallons per day for New pipe lines carrying 50,000,000 gallons per day for New-ark, N J, were undermined and int unsupported for four days for over 35 feet, and in addition to the wight of the pipe and the water passing through them (about 15 tons), there were some thirty up-rored trees piled up over the pipe which supported this immense weight and pressure, without damage. It is conceded that cast iron is brittle and treach

rrous at best and though apparently sound one day, may prove defective the next, and break without a

oment's notice
It is of course true that the strength of any ste

pipe is equal to the stringth of the joints. Sing riveted joints have an efficiency of about 55 per ce double riveted joints about 65 per cent, triple rive counse rivetes points about the per cent, triple rivetes double, butterrap joints about \$0 per cent, and welded joints about \$0, per cent. Leck har joints have are efficiency of 100 per cent, and have greater strength than plates themselves, as all tests result in a failure than plates themselves, as all tests result in a fullers of the plate, which they not be joint. A 48-hack diameter 7/14-inch plate look ber pipe was tested to 1,000 pounds pressure, and the melal of the plate was stretched 4½ inches with neither injury to the lock her joint nor the least leakage along the same. Fur-ther pressure was impossible, because of the blowing out of the riveled reinforcing goods at the inless and,

the gags.
It is maintained that lock bar pips is from 20 to 20
per cent stronger than riveted pips and 19 per cent
stronger than welded pips, and experience has shown
that the natural life of steel pips when properly made
and laid is fully equal to that of cast-from pips.
Without doubt the life of all metal is less than it
to the answer wars are, as nowadays alcotrolysis, sail-

Without doubt the life of all metal is less than it was twenty years ago, as nowadays electrolysis, sulphurous seid, galvanie action and other agents greatly phurous seid, galvanie action and other agents greatly compare the life of pipe laid within the last twenty years and pipe laid prior to that time, because of these constantly increasing corrorive indicances.

According to experiments on the reception of radio-telegraphic signals when transmitting with a spark gap in compressed air, as compared with signals re-ceived when an ordinary spark gap was used, there appears to be no advantage in using compressed air. appears to be no avantage in using compressed air for this purpose. While the delectric strength of the air is enormously increased, so also is the resist-ance to the oscillatory spark, both appearing to in crease in about the same ratio.

# THE WEARING OL

Manganes steel in by no means a new material. But it is a property of the difficulties which manifest themselves in string the difficulties which manifest themselves in string its final facilities which manifest themselves in string that final fine form it seems to have been discovered by Hadfield's Steel Foundry Company, Sheffield, England, some hirter or forty years ago, when seeking a hard and tough substitute for steel when used for cattings it was found that the mere increase of earbon in the was count that the mere increase or dirion in the steel did not have the desired effect. Steel having a carbon content as high as 2 per cent was unsuccess-fully tried. It was known that when the manganese rully tried it was known that ween the mangances content of a steel somewhat exceeded 276 per cent, the sildy would be brittle. What was not known and what the Hadfield Company found out was that if the manganese were increased to a point ranging any where from 7 per cent to 20 per cent a steel might be produced which is remarkably strong and tough be produced which is remarkably strong and tough Now this reversal of a leading property of an alloy by merely increasing the proportion of one of its con stituents is, as R A. Hadfield pointed out, not with In forming alloys of copper and tin the resultant alloys seem to become harder and more the resultant alloys seem to become harver and more brittle as the tim content rises from a low point up to a considerable percentage say 35 per cent, but when more in is present than the soft and tough copper, the alloy becomes softer It was early found, however, that manganese steel was a very refractory metal to machine. The proper

ties of hardness and toughness produced a comtion that was very successful in resisting the cutting tion that was very succession in resisting the obstance edge of the tool And this characteristic is, even to-day, a bar to the application of this metal We have high-speed steels capable of enormous performance blisheaped steels capable of enormous performance when used against the pure arbon steels and east fron. But mangamese steels still hold out. Almost the only practicable think to do is to use the grinder. Now the grinding machine is of late become a strong com-petitor of the ordinary machine is tool. But its develop-ment has hardly been carried for enough to enable it to handle commercially the multiplicity of cutting operations necessary to enable manganess steel to have a general application to all the purposes for which it is highly adapted. Further, it has been found ult to roll

difficult to roll
But so great are the intringic capabilities of this
restardal for certain uses that, in apite of the difficulties of griving it the desired form, it has been perty
rapidly acquiring friends. Consider, for example, the
case of the Borton Elevated Ralivay Company. This
corporation operates its transportation, system on a

wing extraordinary wearing qualities of manganese size rails.

This carre has the small radius of \$5 feet. PARE STREET CURVE OF THE BOSTON SCHWATED BALLWAY OF WHICH STREETS WHAR OF BASEA SOUTHERS.

# NGANESE STEEL

others have radii between 100 and 150 feet. constra have read between 100 and 100 rect. Soon stars operation began, those in charge became im Presed with the fact that an enormous destruction of rails was taking place on the curves. This has been ascribed largely to the sharpness of the curves, and to the combination of grades and curves. It was been aserbled largely to the sharpness of the curves, and to the conjunction of grades and curves. It was on the curve of the Park Street south-bounds track to the conjunction of the park Street south-bounds track of the park Street south-bounds track the state of the park Street south-bounds track that the state of the park Street south-bounds track and sharp south-bounds track and ship-action Beassmar rail were all tried The last was the only one which had even a moderate life—10% months. Nichol stead was tried on a sea of the state of the sta had to be taken out because of its failure to equal the companion. The center of the head had been were down over \$\%\$ lacks while the corresponding position of the property of the companion of the center of the

# THE CONTAGIOUS DISEASES OF METALS

THE RESEARCHES OF PROP. ERNEST COHEN

It has been known for some time, and probably one in antiquity, that makes are subject to diseased considerate. Prof. Erroset Cohem's researches have thrown strained, moreover, the contagions nature of such demonstrated, moreover, the contagions nature of such date lesses, that is to any, a piece of diseased metal has the power of infecting, by a not of catalytic action, a piece of sound metal with which it is in contained.

The second

THE PEST In 1851 Erdmann, in a communication made to the Reyal Society of Sciences at Leipsic, called attention to a peculiar structural modification of tin which he had observed in some old organ pipes. He attributed the change to the vibrations to which the metal had

the change to the vibrations to which the metal ball been subjected. In 1889 Fritzsche of St. Petersche of St. Described observations of similar phonomena, and agginged the opinion that the alteration in the nature of the tim was due to the action of sewere cold to which such in had been exposed, and verifical to correctness of this theory experimentally Other in versigators turned their statemin to this subject, but the true nature of the modification and the exact con ditions governing its appearance and development were not fully understood until they were determined by Prof. Obsets. by Prof. Cohen.

by Frof. Coban. The disease studied by Erdmann and Fritzsche is designated by Frof Coban as tin past. The metal thus affected weells in spots, forming ward like bilaters, from which small drops issue and hang supposed in very much the same numer that drops of quicknives will adhere to polished copper coins in the further propries of the disease, the bilaters between the contract of the disease larger and the metallic

gioss disappears more and more The interior of the mass is affected last, as can be shown by sawing through the metal whose sawing through the metal whose surface has become quite dull When the entire mass has been transformed, it crumbles read-ily, and consists partly of a granular powder similar to granular powder similar to sand, and partly of more or less consistent fibrous lumps of all sises up to that of a fist. When a place of tin is cooled artificialthe modification appears first ed spots, from which it at isolated spots, from which i spreads in wart-like blisters and later forms a columnar struc-

Tin thus modified by a of cold is distinctly gray,

Action to town a metal produces a remarkable change. Even by merely covering it with hot water, the dark gray color is the control of the con

it was before heating If modified, tin is heated to fusion, an appreciable proportion will remain in the oxidized state The moditon portion will upon solidin assume the appearance of ordinary tin, and if cooled to a low temperature, it can be transformed

Brass kettle correded by the wrought metal

again into the gray modification. Ordinary tin has a specific gravity of 728, but gray tin is considerably

lighter, having a gravity of only 5 75 Prof Cohen directed his attention at first to deter-mining the temperature at which ordinary tin is

Antique coffee pet perforated by the tin Results of inoculation with wrought

transformed into the gray modification, the results obtained by former investigators differing widely, some having found 35 deg (Centigrade) as the critical point, others 100 deg., etc Fritzskho's experiments indicating that the transformation was enanticle, it was to be exper tropic or re would be a definite temperature at which the trans-

formation might proceed in either direction Prof Cohen employed two independent methods for determining this critical temperature One, an elec-trical method, consisted in bringing two separate trical method, consisted in bringing two separate bodies of gray thin fao a vessel containing a 10 per cent solution of chlorostannate of ammonium. The two bodies of this are connected with an apparatus permitting the experimenter to observe and measure any electromotive force artising in the cell. As long as both bedies are of the same temperature, there is no selectromotive force. But if now of the the bodies is given the temperature of boiling water, and the agreement of the contraction of the contraction of the force of the contraction of the contraction of the contraction of the force of the contraction of the contraction of the contraction of the force of the contraction of the contraction of the contraction of the force of the contraction of the contraction of the contraction of the force of the contraction of the contraction of the contraction of the force of the contraction of the con formed into ordinary white tin, while the cooled body remains gray The electromotive force manifested remains gray The electrometive force manufactual under these conditions was measured at different tem under these conditions was measured at different tem peratures At about 20 deg C the electromotive force was equal to zero, indicating that the critical tem perature is in the neighborhood of 20 deg. C. Prof. Cohen also found that the presence of the chlorostannate of ammonium solution accelerated the transfor-mation considerably, in both directions

The other method was a volumetric one based on the fact, stated above, that the two forms of tin have different specific gravity. The apparatus employed is very similar to an ordinary thermometer, except that the capillary tube is open at the top. The lower part of the bulb is filled with gray tin, the upper part and a portion of the capillary tube with a liquid inert relatively to tin, such as petroleum. The apprratus is heated to a temperature (say 25 deg C) a few degrees above the probable critical point, so that a

portion of the gray tin is trans formed into the white variety Then the apparatus is kept for some time at a constant tem-perature of say 21 deg C and the perature of say 21 deg C and the behavior of the petroleum col-mm is observed by means of the scale. After a few minutes it will be found to have fallen a few millimeters thus indicating that 21 deg C is still above the critical temperature, for as long as the formation of white tin continues, the mass of tin contracts in volume, owing to the greator specific gravity of w tin The temperature being then kept constant for a time may at 15 deg C, observation will above a rise of the petroleum column, thus indicating that the volume of the tin has increased by the formation of the specifically lighter gray tin, so that the crit ical point must be above 15 de-C. By successive operations a gradual approach to the critical

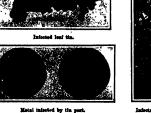

point is obtained by working at temperatures alter-nately above and below said point, and when the limits have been restricted sufficiently, interpolation is limits have been restricted sufficiently, interpolation is resorted to. This method also showed that the critical temperature must be in the neighborhood of 20 deg C and careful determination proved it to be almost early 18 deg Centigrade (about 65 deg Fabrenbeit)

Since all tin utensits employed by us are made of the white modification, it follows that they are gen-

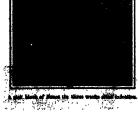

CONTRACTOR MINIMAGES OF MINTALE. .

Infected sheet tin from Retenburg (ity Hall.

erally in an unstable compan and Hable to be transformed partly into the gray variety, except on days when the temperature exceeds 85 deg Pahrenbelt.

The second method described above was also utilized to assertion at

riain at what temperature the trans tion of white tin into gray tin proceeds with the greatest rapidity and this was found to be the case at about 48 deg. Centigrade below zero (about 54 deg F

An interesting discovery was that the trans tion is hastened considerably by the presence of a few particles or "germs" of gray tin it follows that it an "infected" piece or object of white tin is left to itself at temperatures below 65 deg. Fahrenheit, the transformation will proceed constantly and with in-creasing rapidity, for each particle of gray tip, as creasing rapidity, for each particle of gray the, as soon as it is formed, becomes a new germ accelerat-ing the transformation. Prof Cohen has given this phenomenon the name of the pert in view of the germ like or infectious aution of the gray its particles, and also in view of the fact that the time so stacked is practically ruined, since the restoration of the ly moiting in attended with great losses owing to the string cutdation which takes piece during the besting, on account of the finely divided condition of the

The formation of blisters during the conversion of the tin into the gray variety is a natural consequence of the increase of volume, since gray tin is about 25 per cont lighter than white tin

Tin articles which have been exposed to low tem peratures for a long time, may several centuries, would naturally be expected to exhibit a maximum of deterioration This is indeed the case, as has been deterioration This is indeed the case, as has been proved by the condition of antique tin vanes, media, and other objects dug up in our times. In museums, too, the deterioration of tin articles has been observed frequently, but the cause was not understood and no remedy was known. In the light of Prof. and no remedy was known in the light of Pref Cober's discoverie, the remedy is simple we have only to see to it that the articles are never exposed to a temperature below 18 dey Contigrade (65 deg Phiroshett) Investigation has shown that in man, cases where excessive and apparently unaccountable deterioration of its naticles had been reported, that articles had been exposed to low temperatures during ,

WBOUGHT METAL DISKARS Strange phenomena were observed by R. von Hamb-linger at the tinned solder seams of an air-compressor made of tinned sheet iron. The solder had melted way in spots, as it were, and had assumed a crystalline structure, the tin covering of the sheet iron had dar and dull on its entire surface. It Decomo granular and dull on its entire surrace. It was unlikely that the receive the compressor had seldom, if ever, been exposed to temperatures below its deg Contigrade R. von Hass-linger nevertained that pieces of this diseased the would infect sound tin, and that this was apparently independent of the temperature thus indicating again that the form of tin pest previously recognised was cause of this newly observed tran not the cause of this newly observed transformation?
The tin became crystalised in minute wartlike
bodies and the dull portion would spread with the
locate of growth decreased with the increasing
distance from the center of infection. R. von Hassillager thought that the phasomenon was due to crystallisation, and continued his experiment, showing
that the modified in had a lower melting point than
the original metal, about 256 deg Contigrade instead
to 182 deg P. a last found that in full infected on one side would become modified on both sides Other experiments made by him, however, seemed to indicate that the crystallization theory was erroneous, and he published the result of his observations with an acknowledgment that he was unable to account for them. An untimely death having prevented von Hasslinger from concluding his investigations, his teacher. Guido Goldschi niedt, of Prague, drew P Cohen's attention to the unexplained phenomena and

aggested that he continue the research Prof Cohen repeated von Hasslinger's experim and verified them in many ways. He ascertained that the small lead contents of the tin would in no way be held responsible for the result. He first believed that the phenomena might be explained by the forms tion of the rhombic modification of tin which is un stable at temperatures below 161 deg C, having a tenwence to resume the normal tetragonal form. If this hypothesis had been correct, the phenomena should have been absent at temperatures of 181 deg. C. and above Experiments, however, showed that the transformation into the new dull non-degree. formation into the new dull powdery form of tin took place at 184 deg. C even more rapidly than at lower temperatures. This hypothesis therefore had to be

abandoner
Prof Cobes then turned to another explanation,
based on two well-known facts First, that a metal
whight has been subjected to a tensile or to a congression strain (such metal being designated as
"wrought mpta" by Prof. Cohen) has an electricitytic
speciate presente higher than the same metal if it

has not been subjected to meckanical forces; "search, that several metals, tin among others, have the prep-erty of recrystallisation, that is, of exhibiting a growth of their individual crystal grains, more particularly at high temperatures

stendarly at high temperatures. It is well known that two specimens of "wrought metal" are seldem absolutely identical in an election absolutely identical in an election price sens, and "wrought metal" in an unstable condition, having a tendency to return to the condition of "unavrought metal" "Ihi standency, slight at ordinary temperatures, ought theoretically to be strengthened by an increase of temperature, within certain limits, and it is also to be expected that certain limits, and it is also to be expected that certain limits, and it is also to be expected that the transformation. These theoretical deductions have been fully confirmed by experiments.

Perf Cohea Cleaned some plates of timed sheet iron

Prof Cohen cleaned some pistes of tinned sheet iron with hydrochloric acid and polamium chlorate. This produces, in a short time, the well-known metallic moiré effect. The surface is then washed carefully and rubbed with a fine handkerchief. The plate an and rispect with a fine handkerchief. The plate so prepared is pressed in a vise against a highly polished plate of tinned sheet iron, and upon heating to 184 deg. C the polished plate becomes infected and ac-quires the property of infecting others if however-both plates are highly polished, no modification will Another experiment consisted in applying to a moiré plate such as mentioned above, some powdered interted tin foil and on top of this, a polished plate of tinned sheet from Heating to 100 deg. C caused the polished plate to be affected immediately, while the

polished plate to be affected immediately, while the moire plate remained undered even after M hours, more plate remained undered even after M hours, and the second of th

particular conditions. Similar effects of corre were observed on home door handles, and Fred. Coher also thinks that "wrought metal disease" accounts for the peculiar deterioration of the rolled lead roof of a sulfurio acid faciory The temperature of from 40 des. C to 60 deg C., to which the roof had been exp was very favorable to the recrystallimation proof

To the Editor of the Schemeric American:

Relative to your suggestion, regarding the hear word proposed by Mr. Wood, namely, "mechanipulate," it seems to me rather complicated, and I would suggest that the more homely term, machining or machined, would be far mor sald be far more appropriate in the app

Waterbury, Coan.
[The term mechaniquiate does not rafer to the machining" but to the mechanical hadding, 1 c., moving, placing, centering, etc., of a piece of work,

GIVING THE APPRARANCE OF RELIEF TO PICTURES.

To the Editor of the SCHREUPS AMBRICAN'
A simple method of giving the appearance of relief to pictures can be seen by the experience or return to pictures can be seen by the experience that it a shoet of glass with minute cylindrical fluting on a since to glass with minute cylindrical fluting on a since to glass with minute cylindrical fluting on a flutes vertical, be viewed through, the dispersing light gives the picture a stereographic effect of

light gerte solidity.

The utility of a minutaly fluted dispersing picture cover glass screen therefore can be shown, which is dispersing the strength of the critisariosis. cover glass screen therefore can be shown, which is caused by the semicircle dispersion by the cylindrical flutes of the light that is reflected by the photogr The determining factors are the minuteness of the fluting and the position and the thinness of the view

The dispersion of the light by the refraction through these adjoining flutes of this stereoscopic screen pre-lexis to each eye a different appropriate view of the pickees, which produces the impression of solidity and depth. London, Rheland

Scientific American Prince for Inventors. The SCIENTIFIC AMERICAN offers \$100 in three pri to be awarded to the inventor who gives the best account of how he conceived his invention, how he developed it in actual practice, and how he succeeded in selling it. This sum of \$100 to be distributed as follows \$50 to the best account, \$25 to the second

follows \$80 to the best account, \$85 to the second best account, \$10 to the third best account. There is no limitation as to subject matter of the invention. In other words, the invention may be a household utensil, a game, a piece of electrical appearing, an improvement in railway construction, a metalungical process, etc. The following conditions, however, must be observed.

1 The invention must be patented.
2. The inventor must have actually sold his patent, and the invention must have been commercially in-

treduced.

3 The account of the inventor's nuncess must not be longer than 860 words.

4 The completion, letter, or article must be type-written on one side of the paper only

5 The inventor must sign his offering with a pseudoury, and inclose it in a sealed survices, most which the periodorym is written. A second sealed exhibits the periodorym under which the offering or the outside the periodorym under which the offering is substitled, and the docum under which the offering of the outside of Contestants sum deficies their, offerings for inventors' Price Editor, Spranging' Argington, 357 States.

All classes of publications are taking up the propa-panda begun by the American Medical Association; www.papers and magazines are utilizing the statistics risich its Journal has submitted. One magazine magines the results of a vote by Congress to sacri-ce each year one unknown boy as a national Fourth See each year one tinanown nor see a national rousing of-of-July offering—the newspaper extres announcing the grotesque and extraordinary action, editorial denun-ciations of our law-makers, the public agitation and supreme indignation, petitions to Congress and the President, the tunuit that would inevitably attend the rreament, use tumut task would institute attend the execution of such an act of madness. Yet we have supinally been allowing, year after year, with the abso-lute certainty of the result before us, the slaughter of hundreds and the mutilation of thousands of our children, with the natural consequence in suffering, torture of mind, and desolation in many households

Our people are indeed well on the way to grasping Our people are inneed wall on the way to grasping the logic of these presentments. Everywhere individuals, olvio societies, and kindred organisations are at work, measures are on for the formation of a national committee to promote a "safe and sane Fourth", tunate committee to promote a "and as asse Fourna",
municipal authorities are acting understandingly, to
legislation bitherto enacted, more has been or will be
added this year. The action of the Medical Society
of the Siste of Pennsylvania is especially notaworthy
y reason of its comprehensive character. Its Com
mittee on Independence Day Fatalities recommends. Legal control of the importation, manufacture, and sale of explosives used only for purposes of celebra tion; municipal control of the use of firearms and works during the Fourth-of July season, munici pal participation in substitution methods, the organisation of societies for both control and substitution purposes, the most complete possible systematic use

making the heatest, he attained in difficient of 900 feet in a minutes. It took him a half hour to reach the greatest height. It took him a half hour to reach the greatest height. It is descended in circles the same as when he ascended, and when within a hundred feet of the ground, he shut off the motor and gilded to earth he following only Brookine continued his exhibition flights and gave another demonstration of his skill as an aviator by fright for nearly a hour in a skill wind After doing many fancy maneuvers he made a gifde and landed shurest at the skarting point. One of the other Wright machines had trouble with its motor and landed shurest at the skarting point. One of the other Wright machines had trouble with its motor and was unable to make more than a half circuit of the course. There was very little firing this day on account of the wind.

The third day of the meet Brookins again attempted to make an altitude record, but only succeeded in reaching a height of a little over 1.700 feet. After the usual performance of the five Wright hipknes, Orville Wright made a flight in which be performed numerous and daring evolutions over the trees in the surrounding fields. His machine few very steadily and made sharp turns, but did into show the speed that Hamilton subfibited in his Ourties biplane at

is the fourth day of the meet aviator Brookins well sigh, chaffed Grville Wright in the fancy maneuvers he embested and in the sharp turns he made. He creat-

ed a new world's record for turning by making two turns in 6 2-5 and 6 1-5 seconds respectively. The circle he described was less than 150 feet in diameter, The best previous record of this character is said to have been made by one of the Wrights recently at have been made by one of the Wrights recently at Dayton Brookins again attempted to break this atti-tude record, but only succeeded in reaching 3500 feet after a 45-minute ascent. He required only 10 minutes to descend from this beight. Two and three acro-planes were frequently fring together during the after-mond, and at one time the motor in avitator Homey's Wright machine suddenly stopped when he was a bright of 300 feet. He gitted down in a straight line and landed in a field out in a distance away and landed in a field quite a distance away

On the fifth day, Brookins again attempted, and this

time successfully, to break his sittitude record After soaring in wide circles for 40 minutes, he reached a height of 4,503 feet. The machine was but a speck in the sky and on account of the bare and the lateness of the hour, it was sometimes momentarily lost to view After apparently hovering for several minutes, he be gan a slow descent in wide circles. Brookins circled five miles to the east of the motor speedway and five miles to the east of the motor speedway and gradually closed in upon it. He had difficulty in seeing the track because of the gathering darkness. The motor stopped when he was only half way down and he was obliged to make a long gifde. He finally leaded he was obliged to make a long gifde. He finally leaded in a farmer's yard a couple of miles from his starting point. The flight had leated an hour and a half, and the starting that the starting that the starting that the tarty and offer he was the starting that the starting has yet been made The Indianapolis aviation meet did not draw the

crowds anticipated. This was doubtless due to the fact that only one make of aeroplane was used. In order to have a good sporting event, various typ

# THE GERMAN DREADNOUGHT INA

THE FIRST OF THE GERMAN FLEET OF DREADNOUGHTS TO BE COMPLETED

In view of the great secrecy which has attended the construction of the 'Nameau," the type ship of the feet of German dreadnoughts some surprise was expressed upon the first public view of the ship, that expressed upon the first public view of the sing, man-able possessed, as a freadmought, no features of murked novelty. To the people of the United States, there is something familiar about the arrangement of hor main battery, with its armament of heavy guns carried in six turrets, one forward and one aft of the center line, and four arranged amidships quad rilaterally Their thoughts will be carried back some rilaterally Their thoughts will be carried sake some twenty years to the time when the plans of our first battleships 'Oregon," 'Massachusetts," and "indians," were made public The distinctive feature in these vessels was the heavy battery which they carried and vessels was the heavy battery which they carried and the novel plan upon which it was disposed, the pairs of 1 isn't guns being carried in turvels forward and at and the pairs of 5-lost guns being mounted in four inverse two on either beam, arranged at the four corners of the superstructure This, it will be observed is practically the plan followed in the the ships of our own navy, the guns are all mounted upon the longitudinal axis of the ship, and conse-quently the whole power of the 18-inch battery can be brought to bear on the broadside throughout a wide are of training.

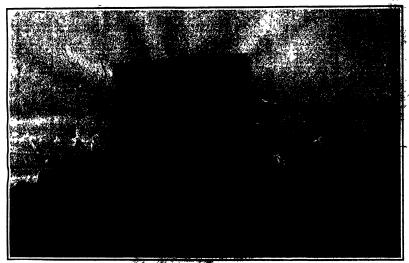

In particulation of their adoption of the quadrilaters' system of securities, the Germans amonance their covered of securities, the Germans amonance their covered to the securities of the fature target will be more fighting in the modes or qua terring position than the advocates of the all-centerline system of monating believe, and they emphasize the test that the "Nassau" can not only concentrate all heavy mus in the sedem position, but that she could deliver this heavy fire, should the citizennies of an engagement demand it, both forward and astern at the same time. Furthermore, there is a certain advocategi in the fact that two gues and four truer's are held in reserve on the less side and are greatly protected by the survive high rar in engagement on what might be called the weather fighting sides of the skip. In justification of their adoption of the quadrilaters'

turret, not eaty would the broadside fire "Naw.u" be iner-said from \$ to 12 heavy we the out-on fire you'dle be trengthessed by no of two more gum, risking it from a consentra-dat to one of eight gum. This is the packed in the new Aryentine crutiers, the most

in the new Argentine cruisers, the most perfections, the new their construction, which also to five eight sens absed or eight assurers on the review on either broadside.

However, in estimating the marits of west sign, we must be carried to been in midd they of displacement, which in the "Nassur' eight, we must Bigues of £500 tons; and, \$\frac{1}{2}\$ to member that our intest dreadmonths have resulted to the control of the "Nassau," have turned out a decidedly

'Nassau" Incidentally, it may be mentioned that the Japanese bave adopted the same arrangement in the first dreadnoughts built for their navy

Obviously, the principal disadvantage of the system is that the ship, although she mounts twelve heavy guns, can bring only eight of them to bear upon either broadside, at least four guns being masked by the superstructure or by the other turrets while she is fighting a broadside engagement with the anemy In Should the weather guns be disabled, it would be possible for the fleet to make a complete turn of 180 degrees, and bring four big guns, with their gun crews entirely fresh, into the fight.

crews entirely read, into the again.

To these arguments it will be answered that, by
moving one of the four amidahly turrets forward and
placing it at a sufficient height to fire above 'the
foremest turret, and removing another of the turrets
att and giving it a similar relation to the aftermost

feet, draft, 28½ feet; displacement, 18,500 tens; normal coal supply, 950 tens. The "Nassau" is driven by triple eagines, and on her trials considerably exny tripie engines, and on her trials considerably ex-ceeded her contract speed of 18 livots and may be set down as a 30-knot vessel. The armanest consists of twire 11-knot, truyine 5-knot, and gittees 4\_65not, guas. Bits is "probated by elegen (notice of Epings guas. Bits is "probated by elegen (notice of Epings), and twitve inches do the goganing-towice.

## An English Judicial Opinion of Complex Patents,

an Kugitha Justical Opinion of Compiler Patentia. The complexity of patent appellication phrasopy, and particularly the bewildering character of the subject of a decision of an American patent, were recently made the subject of a decision of the House of Lords. The case which have member of the House were called upon the tide, was that of Linotype and Machinery Limited va. Hopkins. We presume that the specification, but the hopkins were presented by the patential of the Lords was after the condemnation of the Lords, was after the condemnation of the Lords, was obtained by the American specification field in Engined without any change. The tollowing is an extract from the decision, the unanimous judgment of the first members of the House of Lords. The appelliant (i. e., the patentses) has filed a specification which resembles a treatise in its length;

it contains no less than sixty claims; there is infinite it contains no less than sixty claims; there is infinite redundancy and repetition and constant reference to illustrations which are not very easy fooliow. Alternative she have been been been from the paster it is a document which aped the most prolonged and posterating study in order than aproxon. Who wishes no work out problems of inquestion in this class of industry, my know where they stand and how they may be free from the danger of indusing the free from the danger of industry.

remove passence.
"The point whether this patent is good of sort does
not arise in this case, but I think by in six disty
acts applicably that those who fire, and severe specific cations must take the risk of having the whole there

tailimation but vigorous shaking for about ads invariably transforms the liquid into a lite mass. At the moment of the solidifica solid white mass. At the moment of the sol tion the cold tube instantaneously becomes hot

The property of suitd camphor to rapidly melt into a liquid compound whenever ground or shaken with solid chioral hydrate is used in the other test tube solid chloral hydrate is used in the other test tube the two chespitals must be findly produced and the campber is sprinkled with a few drops of alcohol be free being ground. The two white produces look atthe and are superposed in the tube two parts in volume of campbor being taken for one of chloral hydrate. The shaking rapidly intree and liquedes them Large tubes or bottles of any thickness can be used when the experiment is made in a hall. The fusion of salol is then produced in a water bath

# SEISSLER TURES FROM RELECTRIC LIGHT BULBS.

Many people have wished to perform experiments with Geissler tubes but owing to their high cost have not been able to do so. By the following simple and inexpensive method

anyone who possesses a one inch or larger induction cell can make a very good substitute for a Geissier tube from any of the standard electric light bulbs tube from any of the standard electric light bulbs Burnad out lamps or lamps in which the filaments are broken give the best resultá and can be had for next to nothing. The effect is much bester if the filament is broken into fine places, as it then does not interfere with the distance; in the bulb Metal filament end with the dandarps in the bulb Metal filament end to be bulb of the places, as it then does not interfere endarly be broken by striking the lamp with the hand bull in arrive lamps the filament is count times us tought in arrive lamps the filament is count times us tought in arrive lamps to be fully a striking the striking of the strik

Allowing just the right amount of air to leak in is rather difficult process but it can be done most ply as follows

simply as follows. Inside of making a wax cone as in Fig. II make a bell shaped piece as in Fig. III. With a sirry fill such a sirry district the size of the sirry will come. The purpose of this lick is to holp the spark puncture the sizes. It should not be made deep nough to allow any air to enter the bulb. Next stick the wax bell on the bulb no that the end of the wire rate in the bulb no that the end of the wire rate in the bulb not have the size for the size of current The spars will jump through the place and whatever air is in the boil will leak into the bulb By varying the size of the bell different colored glows may be obtained. The wax bell in Fig 111 shows about the size for the best results with 16-candle power lamps the sus for the best results with 18-candle power samps Different lamps give different results so that the exact size of the bell cannot be determined and striations are more or less a matter of luck. Almost every bulb made as above will show beautiful color effects each different from the other and the results are well

# CONSTRUCTION OF A SUMPLE ELECTROLYTIC INTERRUPTER.

The electrolytic current interruptor described here buy be used in place of the treublecome vibrator on part colin. It is to be operated on 50 to 200 volta

direct or alternating current The interruptions of circet or assertating current. The interruptions occurred that the type of interrupter are very high, being in the neighborhood of 1000 per second. The selectroites and electrodes are contained in a wet battery jar. A wood plug should be turned to

wer battery jar A wood plug should be turned to fit tightly in the top of the jar and bolled thoroughly in parafin to protect it from the acid fumes. A glass tube 6 inches long with an internal diameter of ½ inch should be procured and a hole slightly larger than the external diameter of the tube bored through than the external diameter of the tune nored through the center of the wood cover The tune is hild in posi-tion by a heavy brass spring pressing against it For the anode a 1/2 inch round brass rod should be straight-

A SIMPLE REMOTROLYTIC INTERPUPTER

and so at to allow very easily through the giase tube of the one and of the red should be spared off and the other and threaded and a taped brase hall fitted to it. T is weight br as validation freeds the red into its solution as it is used. One side of the ball should be taped and fitted with a binding next for connecting pur poses. The extincide consists of a local strip it by it by poses, the extincide consists of a local strip it by its consists of the extincident of the control of the contro ened so as to slide very easily through the glass tube One end of the rod should be squared off and the other a third full with a 10 per cent solution of subparts, or after as of piece to wood cover on furth leaves the gissa tube through the hole will it is ½, is the from the bottom of the Jar and thighten the spring against it. Then put the root through the sizes cross rife if it is testing on the bottom of the jar in use when the cleaning through the apparatus we alwards were considered to the piece of the piec a third full with a 10 per cent solution of sulphuric intended for continuous work the electrolyte another be cooled by running water through a coiled glass tube in the bottom of the jar This interrupter will successfully operate coils from the small sizes up to the 10 inch airs and is especially desirable in wire loss telegraphic transmission as it side materially in the production of a penetrating high frequency wave

### DEVICE FOR TESTING ELECTRIC WIRING MT IS WARD IS NO HOLD

In testing electric wiring for open circuits grounds or short circuits it is often necessary to skin the in sulation from the wires under test in a number of places so as to connect them to a magneto or off testing device. The accompanying illustration sho

MICROSCOPE ARRANGED AS POLARISCOPE.

think this apparatus can be excelled. The pl to be derived from its use is infinite

AN ELECTROPLATING OUTFIT

Those who wish to indertake the electro-deposition of metals upon a small scale whether as a business or for pleasure will find that the apparatus and utensils isors described will meet the ordinary require-

The photograph reproduced herewith shows the wooden depositing tank and battery of an outfit in actual use. The battery cells are made exactly as explained on page 445 of the Scientisto American of

The depositing tank is made in the same way, with the exception that the joints are put together with a very thick India rubber cement of the kind used for airing tires The woodwork at the joints is first coated with the cement, both at the grooves and the ends, and is allowed to stand for an hour or two, when it is coated again and put together either with ualls driven in diagonally or with screws. The ex-cess of rubber must be wiped off. In the course of about twenty four hours the inside of the tank must about twenty four hours the inside of the tank must be coated with a burning bot solution of parafin. I'n less the parafin is very hot, it will not penetrate the pores of the wood sufficiently to make it impervious to any of the chemical solutions that the tank may to any of the ceminal solutions that the tank may contain the wood used in making a depositing tank must be well seasoned if possible use old boards one inch thick so that when planed the board is not less than sever-eighths of an inch thick, and at all times place cleats across the bottom, so that it will stand clear of the floor or work bench. The rubber comment used for the joints will not be affected by any of the depositing solutions. The tank illustrated measthe depositing solutions The tank illustrated measures 51/2 inches wide, 121/4 inches long, and 11 inches ures by incare wice, 12½ inches long, and 11 incare deep. Five such tanks as these should be made, to contain the following cold working solutions, for all tor, nickel, brass copper and size Gold and alkaline coppering solutions must be worked hot, as will presently be described

- Dissolve 21/2 ounces silver in a Biller Reiting- Dissolve 31g ounces silver in a giasa flask by adding 1 ounces intrice soid and 1 ounce distilled water. Heat the flask slightly and place its where the red alterna times will use and its to a flue, or out of doors. When the aliver has become dis-solved, add a quart of distilled water, sit the nut-ture well, then add gradually about 5 fluid ounces pre-hydrochlor soid, striving the mixture well with a giasa rod. Place the fluid is a fluid ounce of the white predictate (salkytik) of sliver) is settling, the white predictate (salkytik) of sliver) is settling. Four off the clear liquid, add shother quart of water; stir well, allow it to actile, decent; and weath a third time. This will free the precipitate of impuritive formed. Dissolve % pound organide of potassium in % gallon of distilled water When completely de-½ gailon of distilled water When completely dis-solved, add a small quantity at a time to the chir ride of silver Stir this well, and continue to add the cyanide solution until the chloride of silver has the cyanide solution until the chloride of silver hiss only just been dissolved. Allow a little time to elapse between each addition. When all the chloride of silver is dissolved make up the quantity to 3½ gallons with distilled water This will be the right quantity to fill the wooden tank, with one ounce silver to the gallon Let this solution stand for twenty four hours, so that all dirt will settle, and the pour the clean solution into the tank. The solution

is now ready for use. o sheets of fine silver about 5 inches square must Two sacets of mas silver about a locuse square must be used for the anodes, suspended by either copper or silver wire hooks upon the copper rod (shown in the illustration) attached to the wire from the carbon of the battery, while from the bent copper rod the articles to be plated must be suspended, this rod be-ing attached to the since of the battery. The articles to be plated must be cleaned by boiling them in a strong solution of common washing sods for twenty minutes, rinsing in water, and scouring them indi-vidually with a stiff nail brush dipped in pumics powder or brick dust. Articles of German silver brass, or copper, after scouring and being attached brass, or copper, after accouring and peans attached to the slingfug wire, must be dipped into a solution of one ounce of nitrate of mercury in a gallon of water This will give a chemically clean surface and cause the sliver to adhere firmly when the deposit takes place in the silver bath. Threet or first apon or fortis should be submarged in the pinting limit quickly, before the made of others in many the this conducting the made of others in many the side of it. 1910 and 1910 and 1910 and 1910 and other in the side of the side of the side of the side of it. 1910 and 19

color of S.

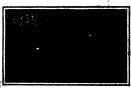

Copper Flots: Articles and Copper Flots: Articles and Copper Flots: Articles and Copper Flots: Articles and Copper In S. Articles and Copper In S. Articles and Copper In S. Articles Cop mula given Dissolve ¼ pound sulphate of copper in ¼ gallon hot water Also ¼ pound carbonate of pot ash in 1 quart of water, and about 10 ounces cyanide of potassium in 1 quart water. Add the cart or potassium in I quart water And the earponate of potash solution to the sulphate of copper Sitt the mixture well Add enough strong liquid ammonia to dissolve the precipitate Then add gradually the cyanide solution until the blue color disappears.

Make up to 2 gailons with distilled water, and after stake up to 2 gainons with distilled water, and arrest allowing the sediment to subside, pour off the clear liquid into the depositing tank. Have two anodes after inches square using the second anode according to the number of articles to be plated. The two battery cells above referred to will perform all the work of deposition that this article describes. The cleaning of small iron or steel articles should be done just as described above for allvering. When the articles are coppered they must be scratch-brushed before receiving a deposit of nickel, silver, or gold; then secured with fine pumice and water. They will then take a ne deposit of these metals.

Gold Plating —Electro-gilding in a small way is

best done by making the gold solution as follows Dissolve in 1 quart of hot distilled water 1 curies of Dissolve in 1 quart of not custume vater; course, correct or coverage of the c of separat where it can all manners, then have been pot. MANGARIME STREET MAILS

rails used by the Boston Elevated upon the current series of course, an expensive process in fact, this corporation rail conts about \$5 per foot for the rails. The ord nary rail costs only about 38 cents foot, or only 1/3 as much. But even then it is regarded as a good investment, because of the very long life. In the au tumn of 1908 the company had in service tumn or 1908 the company had in service 476 feet of this rail in addition to three crossing frogs and a number of ordinary frogs. Its experience is certainly worthy of attention However, if manganese steel can be rolled to advantage, we may steel can be rolled to advantage, we may expect a still better material at a lower figure. In fact, such rails have been rolled to sell for about \$200 per ton, or about \$2.50 per foot (about 85 pound sec tion).

Perhaps expense of rolling manganese-steel raits is due to the considerable piping to which ingots of this material are subject, requiring thus a large discard or special means of prevention On the other hand, considerable blow holes are thought to be infrequent, if they occur at all This is attributed to the high percentage of substances which have a stronger affinity for oxygen than iron This will be bet ter understood, perhaps, by considering

Bome of the difficulties of rolling this motal have been given by Mr W 8 Pot ter When the temperature has fallen as low as about 1,300 deg F. 1t becomes approximately the continuous and the second of the second o low as about 3,000 deg as 1.0 miles as along a second of the second of t cracking for the reason that then the steel will be put to crush in the mill Apparently, the upper limit beyond the steel will be the steel that the steel steel the steel will be steel that the steel steel steel that the steel s it may be that manganess steel may cool somewhat more slowly than the ordinary rail steel. But we cannot expect the difference between 575 deg and 900 deg to be thus made up. So that, if we should proceed by the usual methods, we would be unable to secure our desired result. However, manganess steel has been suc-cessfully rolled in France, in England, and in the United States.

delphia was reached he the train and, before aligh two large circles above the field that was his dostination The greater part of the trip ilamilton w at a comparatively slight elevation

-about 200 feet Even in passing over the city of Trenton he rose to only douthe city of Truston me rose to only un-ble this height, as he preferred to take the chance of his motor stopping and of his being obliged to descond rather than to cut down his average speed by rising to a great elevation

The various cities and towns along

the route were passed upon schedule tim

After reaching the field at North Phila delphia and circling about a couple of times Hamilton alighted gracefully at 9 26 A M, just 1 hour and 50 minutes from the time he started If a deduction is made for the circling about at the start and finish, the actual time of the flight was about 1 hour and 45 minutes was about 1 hour and so minutes 2 no airline distance is 747 miles from Gov-ernor's Island to North Philadelphia, but ernor's Island to North Philadelphia, bott over the route followed by Hamilton it was 839. The average speed, therefore, with the time of the circlings de-ducted, was 4737 miles an hour, or 45.83, using the full time in tother words, Man-istand in New York harbor and traveled to North Philadelphia in considerably to North Philadelphia in considerably to the philadelphia in considerably journey by boat to Jersey City and

Useful Book Experimental Science

A Complete Electrical Library

After being greated by Governor III art and delivering to him the meaning as shown in one of our illustration Hamilton redilled his fuel and oil tank spite the fact that the train was at the fastest possible speed-\$4 an hour or more-its occupants did no catch sight of Hamilton until 22 min cates signt of Hamilton until 38 minutes after they started, while it was about 10 minutes later before they finally over-hauled him, 2 miles beyond Princeton Junction and 39 miles from the start. Thirty-seven miles had been covered by the special in 34 minutes, including a stop of 2 minutes at Bristol caused by an express train being in the way. The as express trait being in the way. The train and servicine traveled abreset of each other for a white, and finally Han-ilton dropped slightly behind He had-covered the first 38 miles of the return formers at the rate of 51.3 miles as how, thus making the fastest cross-country fight yet accomplated at the small vil-lage of Patinaboro, 41 miles from North lags of Patinaboro, 41 miles from North Philadelpias, Hamilton again few overthe tracks a thousand feet or me the tracks a thousand rest or more much of the train. The heavy clouds of amoke from the locomotive caused him to seek a higher elevation, and he rose to a height of about 800 feet. Soon after crossing the Raritan River the occupants crossing the Haritan River the occupants of the train were surprised to see Ham ilton turn off to the right and pass out of view It seems he mistook the river for the Kill von Kull, and started, of Or the Chill con Kull, and started, of course, where the course is a second of the course of course of the course his setting this propeller—which, by the way, was the one that Curties used at Rheims in the Gordon Bennett race—but a soon as it arrived Manifort immedi stair put it on and started once more, at 6 if P M. As the propeller was cracked and land been patched up with these tig. Himilton feared it might break before he could complete his con-traction of the contraction of the con-traction of the contraction of the con-traction of the contraction of the con-traction o ney He therefore rose to a consid-height—about 1,500 feet—and ms wide circle over Elisabeth While and made a wide circle over Ellasbeth While above the city the engine again started miss lng and running on but six cylinders Fortunately, however, his height was suf-ficient, so that he just succeeded in mak-ing Governor's island during the course ded in makof his long descent. The 19% miles air-line distance from South Ambor to the Island was covered in about 23 minutes, and he finally alighted in front of the shed at 6 40 P. M

In addition to this being pr stest cross-country flight ever exe amilton's performance was a spe fastest cross-country fligar ever executed, Hamilton's performance was a spectacular one, since the flight was made over water, cities, and open country. Whem news was recovered at New Tork that he had started on the return trip, thousands of people anthered at the Rattery expecting to see him arrive at Governor's as and at about 15 p M. When word cane that the had been control assignment of the control of t pointed that he was unable to make the return typ, without a nep, 250 wester have been able to do that had it not her for motor troubles. Let far as the seco-plane itself was someomed, this was with Constitution on judge second.

ded according to the seaport from

points are Knyujack, Alden, and Azisick The different brands of course vary ac cording to the purity of the emery—the

larger the amount of oxide of alumina,

The American emery is mined near Peckskill, New York State. Some very excellent one has been taken out at that place but the bulk of the emery is high

in odds of from and therefor soft.

Flore is also a small deposit in the State
of Kansas, but the deposit is insignificant and the quality of the enery of an
interior character.

The following are the physical proper ties of emery. Color black of blue black,

specific gravity, 0 1050 ounce. It is thus placed in scale of hardness. Pure Naxos

84, pure lurkish 84, pure American 84 (the diamond being to 10) In its manufacture the emery passes

the machine, and the aviator mas sugreshed the opinion that some miss-tins piston rings in one gr typo of the cylinders allowed oil to escape by the pigion and foul the spark plugs. There was no interruption in the sparking cur-rent supplied by the high-dension Bosch magneto. At any rate, Hamilton's flights showed the noutbility of securion—"". magnets. At any rate, mamners mignate showed the possibility of carrying mail and important dispatches, and it is interesting to note that Representative Shopherd of Texas has introduced a bill into Congress calling for the investigation o Post Office Department into the sero to for the purpose of carrying mail Also a few days after Hamilton's flight, the French war authorities com manded M Blériot to carry a message from the camp of Chalons to Paris, which he did promptly in his monoplane with out any mishap. During the present week Hamilton is to experiment for the government at Nashville, Tenn upon the dropping of explosites from his machine These experiments will be extried on dur

The flights of Cuttles and Hamilton have spurred many budding aviators attempt in the near future some of the cross country flights for prizes, and new prizes are being offered almost daily for such feats. We wish to remind such avi ators that they stand a chame of win ning the Scientiste Augusta Trouby if they send in their cutiv to us or to the Aero Club of America twenty four hours In advance The aviator making the long est cross-country flight this year will win the trophy for 1910

EN WALTER C COLD

There are three qualities of emery used in this country-Naxos or Greek, Turk ish and American

The Naxos brand is import island of Naxos (Grecian Archipelage) island of Naxos (Grecian Archipolago) Gresco, the mines being controlled by the Grecian government Naxos emery contains a large percentage of slumina, (about 56 per cent) This emery has a most excellent fracture, the grains being very hard and very sharp, and therefore) very hard and very sharp, and therefore especially adapted for use in grinding wheels. These characteristics prevent its use, to any extent, for polishing pur-pages, as it neither "breaks down" nor granulates under pressure of the work, as do the other qualities of Crurkish and American) An ideal emery for polish ing must present new cutting points cor The Naxos grains are so hard and sharp that it does not properly gran ulate, therefore it is not a desirable pol-ishing medium, except for certain special classes of work. Naxos emery, owing to its large percentage of alumina, follows corundum in the scale of hardness

occumbum in the scale of hardness Good Turkins emery contains any where from 15 per cent to 25 per cent cated of from (the larger the per centage of oxide of iron, the softer is the emery) and it is used therefore or clusterly as a polisher on "hard work." Turkish somery has a good fracture, and is just tough enough to make it ideal for

dishing purposes.

American emery contains about 45 per nt oxide of Iron, and is therefore the softest emery produced, yet is succe fully and largely used for certain class of "noft work."

Most of the Naxos and Turkish emery brought to this country comes in piece brought to this country comes in pieces ranging from the size of a marble up to \$5 or 30 pounds in weight. Formerly it was brought over as ballast in ships, but It became such an important con dit it became such an important commontup commercially, that during the last quar-far century it has been transported across the water as regular cargo. Turkish em-tery is brought to the assports of Asia my prought to the samports of Asia Milhor in the same primitive fashion which has exhited for many years—on the back of dample. There are no up-to gate mining methods. The one is taken
